

# 416 Distributed Systems

Networks review; Day 1 of 2  
Jan 5 + 8, 2018

# Distributed Systems vs. Networks

- Low level (c/go)
- Run forever
- Support others
- Adversarial environment
- Distributed & concurrent
- Resources matter
  
- And have it implemented/run by vast numbers of different people with different goals/skills

# Keep an eye out for...

- Modularity, Layering, and Decomposition:
  - Techniques for dividing the work of building systems
  - Hiding the complexity of components from each other
  - Hiding implementation details to deal with heterogeneity
- Naming/lookup/routing
- Resource sharing and isolation
  
- Models and assumptions about the environment and components

# Today's Lecture

- Network links and LANs
- Layering and protocols
- Internet design

# Basic Building Block: Links

- Electrical questions
  - Voltage, frequency, ...
  - Wired or wireless?
- Link-layer issues: How to send data?
  - When to talk – can either side talk at once?
  - What/how to say – low-level format?

# Model of a communication channel

- Latency - how long does it take for the first bit to reach destination
- Jitter - how much variation in latency?
- Capacity - how many bits/sec can we push through? (often termed “bandwidth”)
- Loss / Reliability - can the channel drop packets?
- Reordering

# Basic Building Block: Links

- ... But what if we want more hosts?

One wire

Wires for everybody!

- Scalability?!

# Multiplexing

- Need to share network resources

- How? Switched network
  - Party “A” gets resources sometimes
  - Party “B” gets them sometimes
- Interior nodes act as “Switches”
- What mechanisms to share resources?

# In the Old Days...Circuit Switching

# Packet Switching

- Source sends information as self-contained packets that have an address.
  - Source may have to break up single message in multiple
- Each packet travels independently to the destination host.
  - Switches use the address in the packet to determine how to forward the packets
  - Store and forward
- Analogy: a letter in surface mail.

# Packet Switching – Statistical Multiplexing

- Switches arbitrate between inputs
- Can send from *any* input that's ready
  - Links never idle when traffic to send
  - (Efficiency!)

# What if Network is Overloaded?

Problem: Network Overload

Solution: Buffering and Congestion Control

- Short bursts: buffer
- What if buffer overflows?
  - Packets dropped
  - Sender adjusts rate until load = resources → “congestion control”

## Example: Ethernet Packet

- Sending adapter encapsulates IP datagram (or other network layer protocol packet) in **Ethernet frame**

# Ethernet Frame Structure

- Each protocol layer needs to provide some hooks to upper layer protocols
  - Demultiplexing: identify which upper layer protocol packet belongs to
  - E.g., port numbers allow TCP/UDP to identify target application
  - Ethernet uses Type field
- **Type:** 2 bytes
  - Indicates the higher layer protocol, mostly IP but others may be supported such as Novell IPX and AppleTalk

## Ethernet Frame Structure (cont.)

- **Addresses: 6 bytes**
  - Each adapter is given a globally unique address at manufacturing time
    - Address space is allocated to manufacturers
      - 24 bits identify manufacturer
      - E.g., 0:0:15:\* → 3com adapter
    - Frame is received by all adapters on a LAN and dropped if address does not match
  - **Special addresses**
    - Broadcast – FF:FF:FF:FF:FF:FF is “everybody”
    - Range of addresses allocated to multicast
      - Adapter maintains list of multicast groups node is interested in

# Packet Switching

- Source sends information as self-contained packets that have an address.
  - Source may have to break up single message in multiple
- **Each packet travels independently to the destination host.**
  - **Switches use the address in the packet to determine how to forward the packets**
  - **Store and forward**
- Analogy: a letter in surface mail.

# Frame Forwarding

MAC Address	Port	Age
A21032C9A591	1	36
99A323C90842	2	01
8711C98900AA	2	15
301B2369011C	2	16
695519001190	3	11

- A machine with MAC Address lies in the direction of number port of the bridge
- For every packet, the bridge “looks up” the entry for the packet’s destination MAC address and forwards the packet on that port.
  - Other packets are broadcast – why?
- Timer is used to flush old entries

# Learning Bridges

- Manually filling in bridge tables?
  - Time consuming, error-prone
- Keep track of source address of packets arriving on every link, showing what segment hosts are on
  - Fill in the forwarding table based on this information

# Today's Lecture

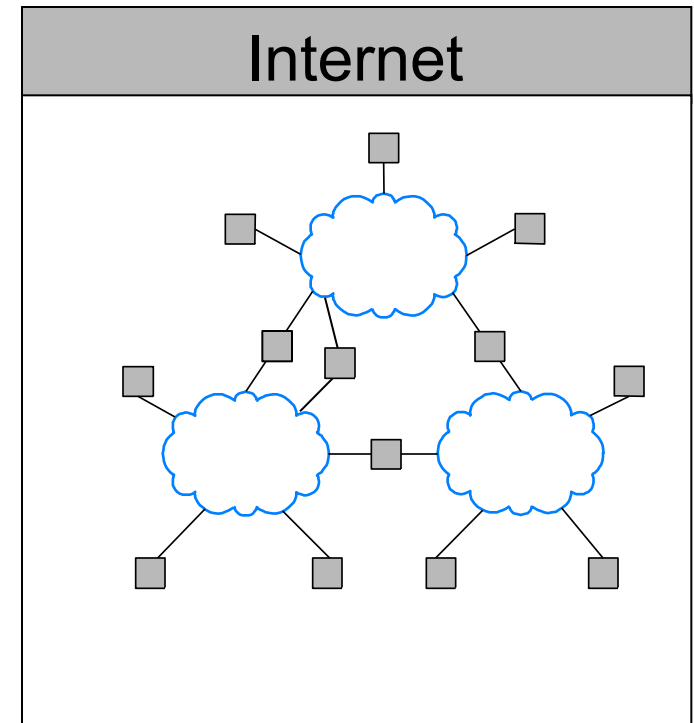

- Network links and LANs
- Layering and protocols
- Internet design

# Internet

- An inter-net: a network of networks.
  - Networks are connected using routers that support communication in a hierarchical fashion
  - Often need other special devices at the boundaries for security, accounting, ..
- The Internet: the interconnected set of networks of the Internet Service Providers (ISPs)
  - About 17,000 different networks make up the Internet

# Challenges of an internet

- Heterogeneity
  - Address formats
  - Performance – bandwidth/latency
  - Packet size
  - Loss rate/pattern/handling
  - Routing
  - Diverse network technologies → satellite links, cellular links, carrier pigeons
  - In-order delivery

# How To Find Nodes?

**Computer 1**

**Computer 2**

Need naming and routing

# Naming

*What's the IP address for www.cmu.edu?*

*It is 128.2.11.43*

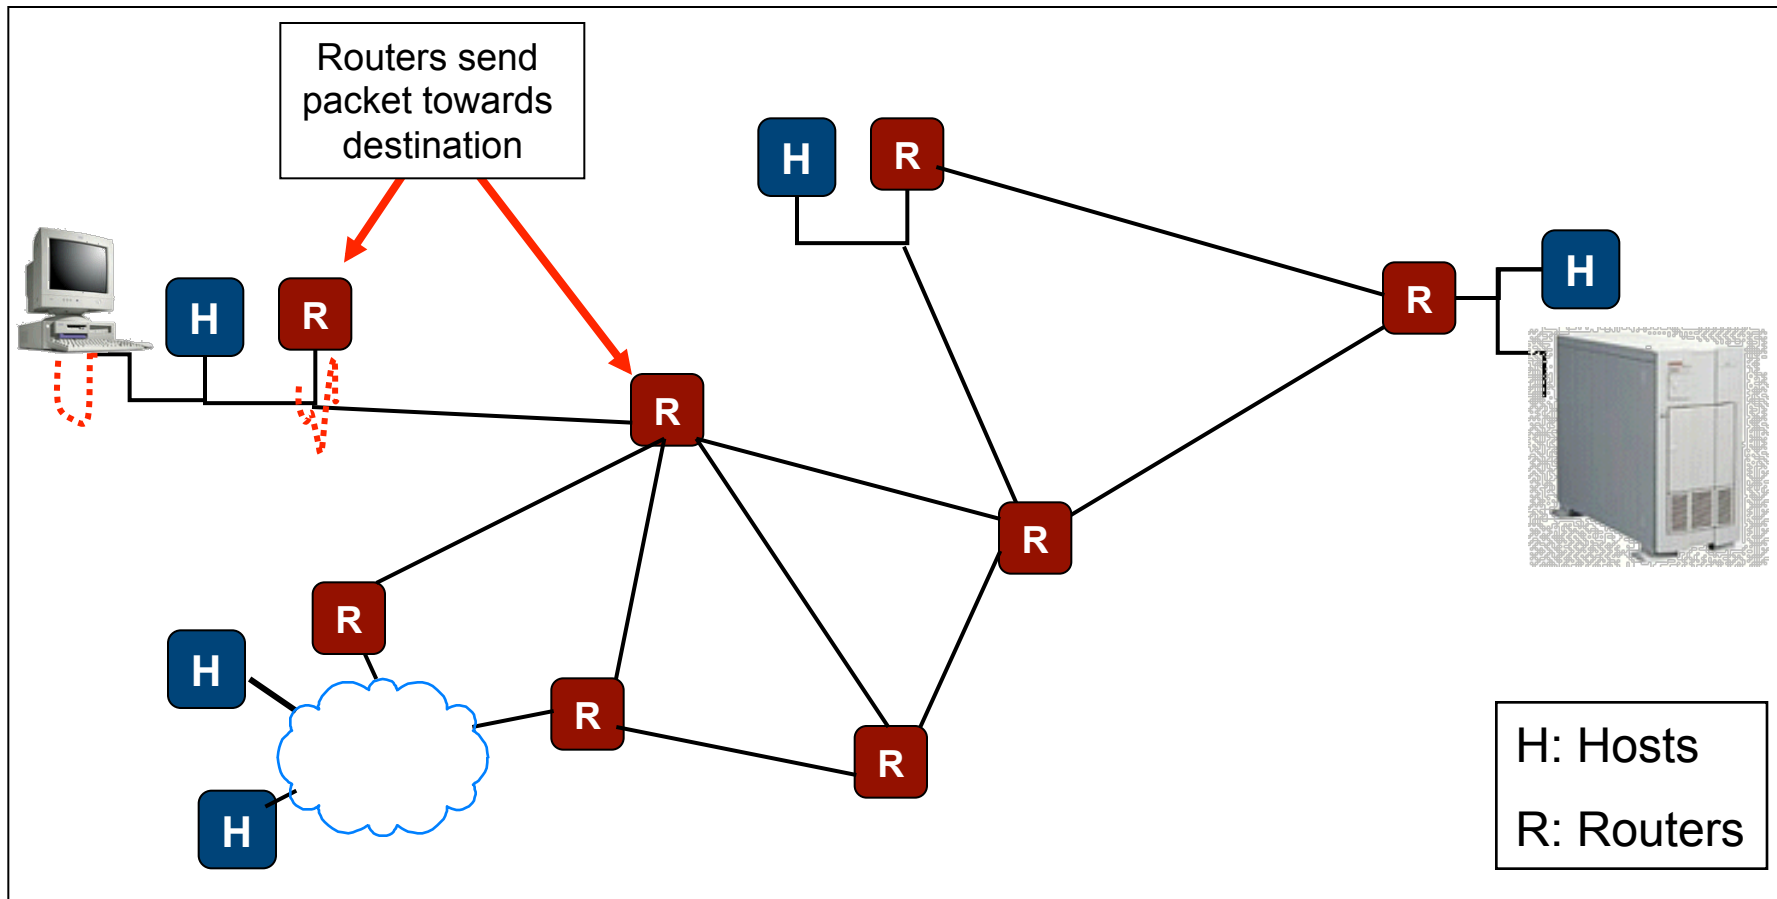

**Computer 1**

**Local DNS Server**

Translates human readable names to logical endpoints

# Routing

# Network Service Model

- What is the *service model*?
  - Ethernet/Internet: *best-effort* – packets can get lost, etc.
- What if you want more?
  - Performance guarantees (QoS)
  - Reliability
    - Corruption
    - Lost packets
  - Flow and congestion control
  - Fragmentation
  - In-order delivery
  - Etc...

# Failure models

- Fail-stop:
  - When something goes wrong, the process stops / crashes / etc.
- Fail-slow or fail-stutter:
  - Performance may vary on failures as well
- Byzantine:
  - Anything that can go wrong, will.
  - Including malicious entities taking over your computers and making them do whatever they want.
- These models are useful for proving things;
- The real world typically has a bit of everything.
- Deciding which model to use is important!

# Fancier Network Service Models

- What if network had reliable, in-order, mostly no-corruption, stream-oriented communication (i.e. TCP)
- Programmers don't have to implement these features in every application
- But note limitations: this can't turn a byzantine failure model into a fail-stop model...

# What if the Data gets Corrupted?

Problem: Data Corruption

GET index.html

GET inrex.html

Solution: Add a *checksum*

# What if the Data gets Lost?

Problem: Lost Data

GET index.html

Solution: Timeout and Retransmit

GET index.html

GET index.html

GET index.html

# What if the Data is Out of Order?

Problem: Out of Order

GET x.htinde ml

Solution: Add Sequence Numbers

# Networks [including end points] Implement Many Functions

- Link
- Multiplexing
- Routing
- Addressing/naming (locating peers)
- Reliability
- Flow control
- Fragmentation
- Etc.....

# What is Layering?

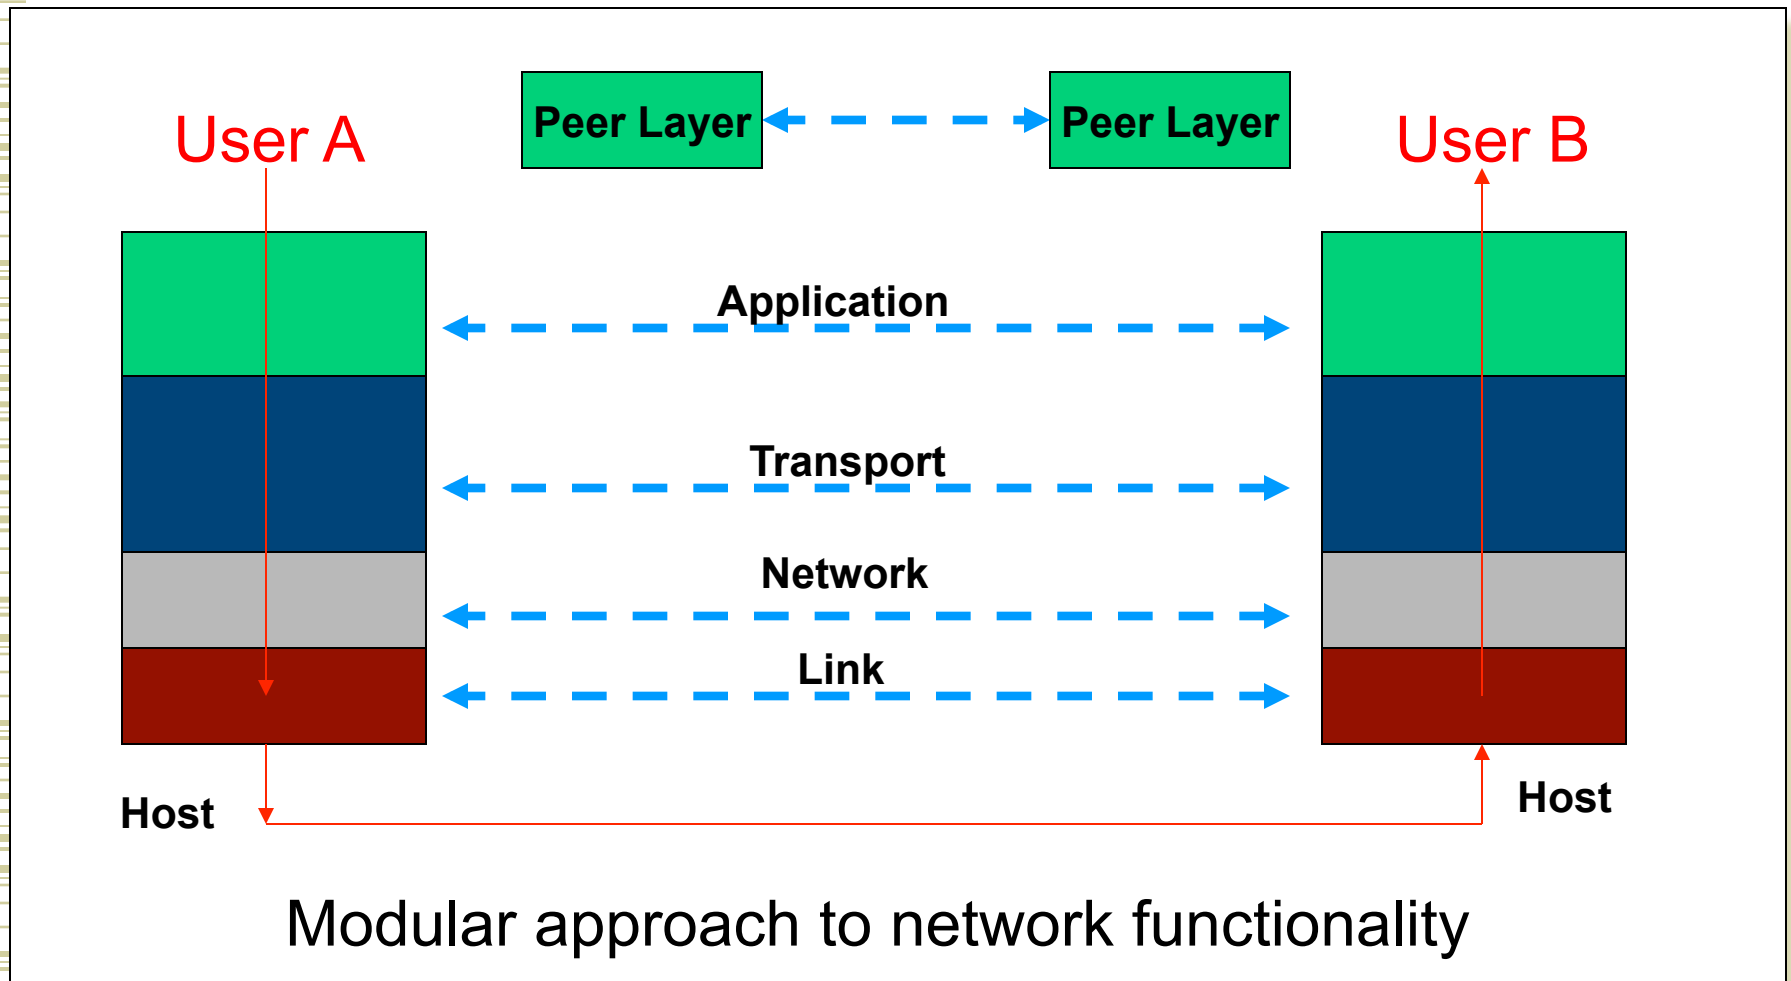

- Modular approach to network functionality
- Example:

# What is Layering?

# Layering Characteristics

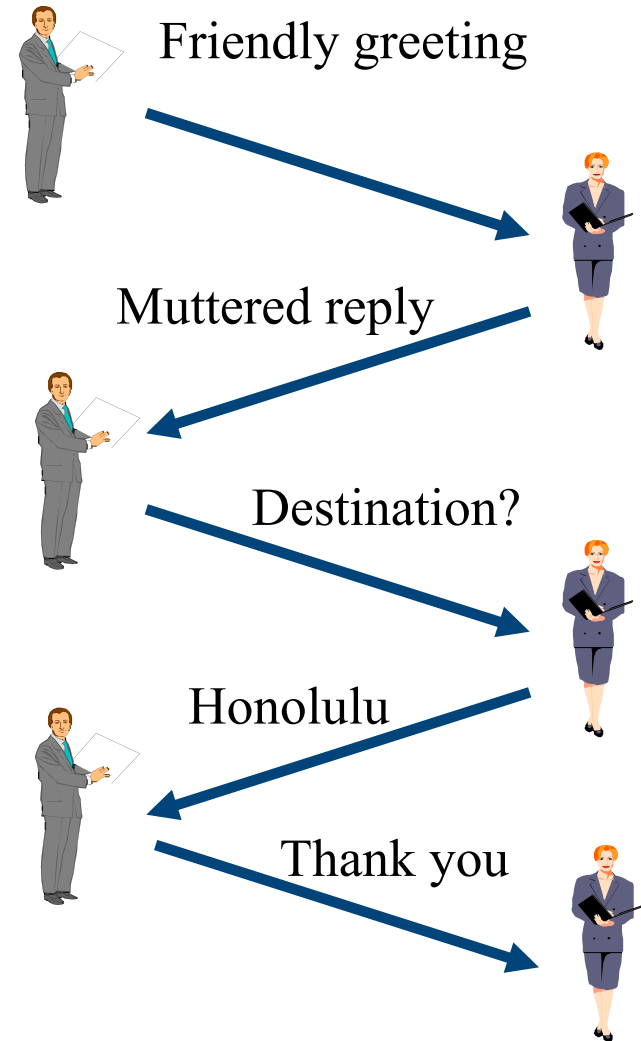

- Each layer relies on services from layer below and exports services to layer above
- Interface defines interaction with peer on other hosts
- Hides implementation - layers can change without disturbing other layers (black box)

# What are Protocols?

- An agreement between parties on how communication should take place
- Module in layered structure
- Protocols define:
  - Interface to higher layers (API)
  - Interface to peer (syntax & semantics)
    - Actions taken on receipt of a messages
    - Format and order of messages
    - Error handling, termination, ordering of requests, etc.
- Example: Buying airline ticket

# IP Layering

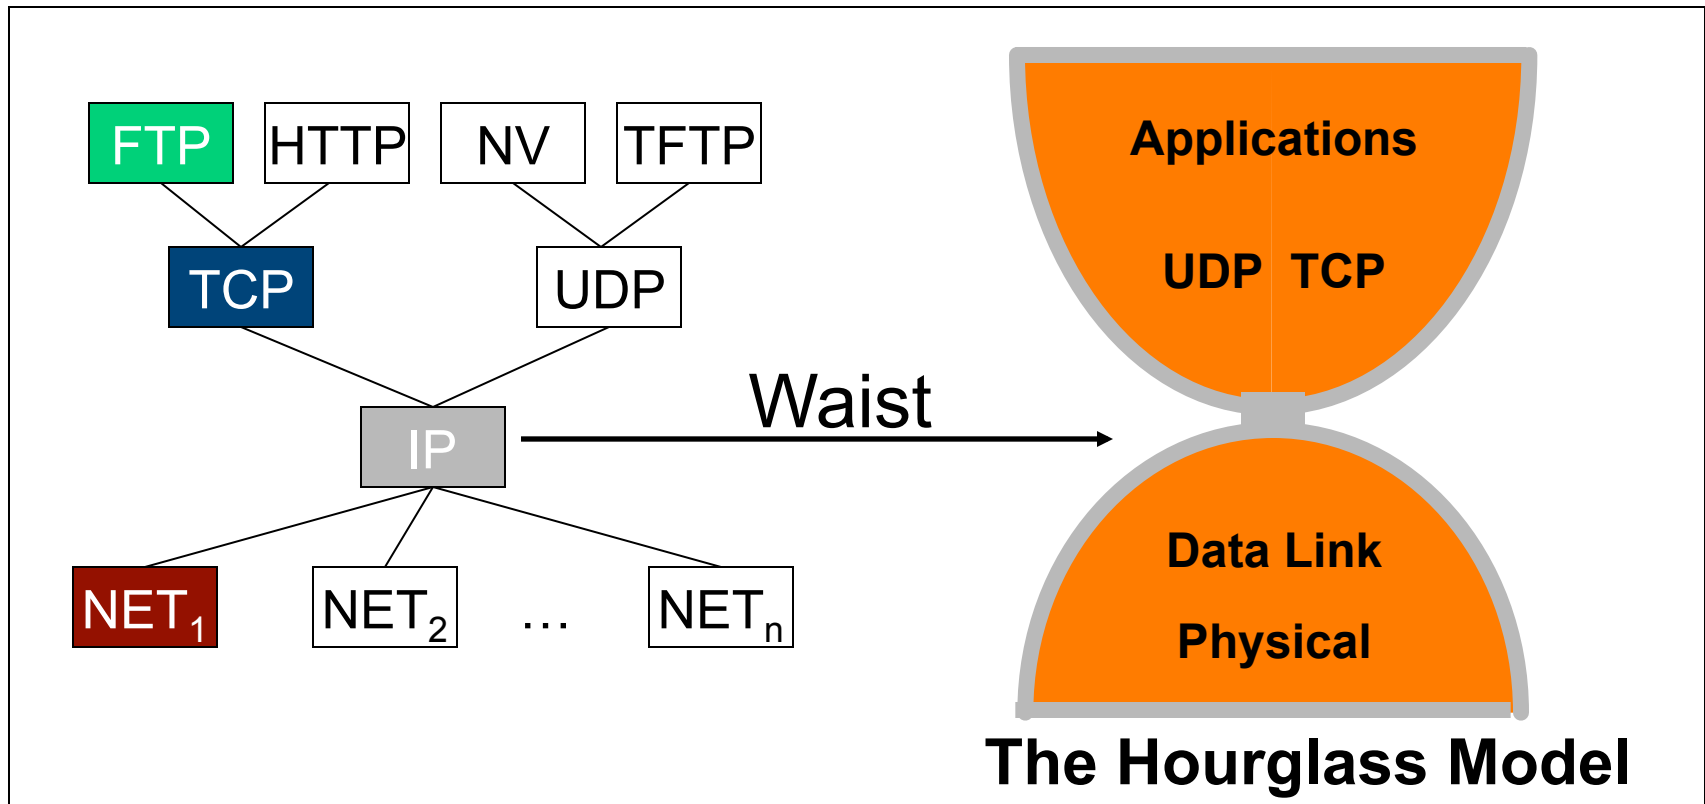

- Relatively simple

# The Internet Protocol Suite

The “thin” waist facilitates interoperability

# Layer Encapsulation

# Multiplexing and Demultiplexing

- There may be multiple implementations of each layer.
  - How does the receiver know what version of a layer to use?
- Each header includes a demultiplexing field that is used to identify the next layer.
  - Filled in by the sender
  - Used by the receiver
- Multiplexing occurs at multiple layers. E.g., IP, TCP, ...

V/HL	TOS	Length
ID		Flags/Offset
TTL	Prot.	H. Checksum
Source IP address		
Destination IP address		
Options..		

# Multiplexing and Demultiplexing

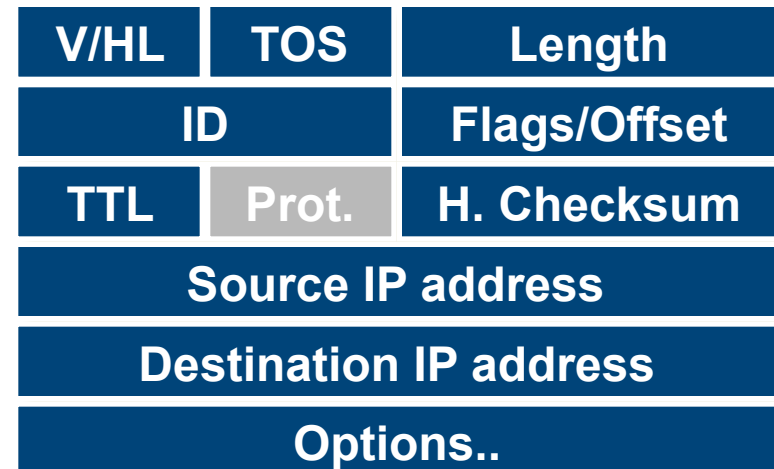

## List of IP protocol numbers

From Wikipedia, the free encyclopedia

This is a list of IP numbers used in the *Protocol* field of the IPv4 header

Decimal	Hex	Keyword	
0	0x00	HOPOPT	IPv6 Hop-by-Hop Option
1	0x01	ICMP	Internet Control Message Prot
2	0x02	IGMP	Internet Group Management F
3	0x03	GGP	Gateway-to-Gateway Protocol
4	0x04	IP-in-IP	IP in IP (encapsulation)
5	0x05	ST	Internet Stream Protocol
6	0x06	TCP	Transmission Control Protocol
7	0x07	CBT	Core-based trees
8	0x08	EGP	Exterior Gateway Protocol
9	0x09	IGP	Interior Gateway Protocol (any their IGRP))
10	0x0A	BBN-RCC-MON	BBN RCC Monitoring
11	0x0B	NVP-II	Network Voice Protocol
12	0x0C	PUP	Xerox PUP
13	0x0D	ARGUS	ARGUS
14	0x0E	EMCON	EMCON

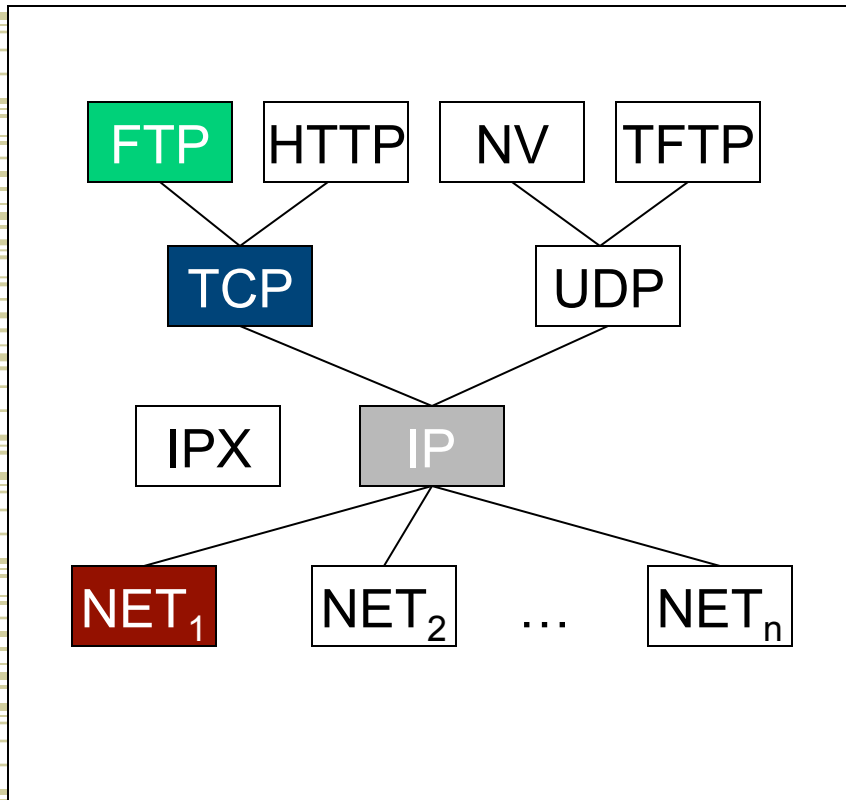

# Protocol Demultiplexing

- Multiple choices at each layer

# Today's Lecture

- Network links and LANs
- Layering and protocols
- **Internet design**

# Goals [Clark88]

## 0 Connect existing networks

initially ARPANET and ARPA packet radio network

### 1. Survivability

ensure communication service even in the presence of network and router failures

### 2. Support multiple types of services

### 3. Must accommodate a variety of networks

### 4. Allow distributed management

### 5. Allow host attachment with a low level of effort

### 6. Be cost effective

### 7. Allow resource accountability

# Goal 1: Survivability

- If network is disrupted and reconfigured...
  - Communicating entities should not care!
  - No higher-level state reconfiguration
- How to achieve such reliability?
  - Where can communication state be stored?

	Network	Host
Failure handing	Replication	“Fate sharing”
Net Engineering	Tough	Simple
Routing state	Maintain state	Stateless
Host trust	Less	More
