

Tamara Munzner

Textures I

Week 9, Wed Mar 14

<http://www.ugrad.cs.ubc.ca/~cs314/V/jan2007>

Reading for Today and Next Time

- FCG Chap 11 Texture Mapping
 - except 11.8
- RB Chap Texture Mapping
- FCG Sect 16.6 Procedural Techniques
- FCG Sect 16.7 Groups of Objects

2

News

- Q3 specular color should be (1,1,0)
- P3: bug in sample implementation fixed
 - new reference images and sample binaries posted
 - no change to template

3

Correction: HSV and RGB

- HSV/HSI conversion from RGB
 - not expressible in matrix

$$I = \frac{R+G+B}{3} \quad S = 1 - \frac{\min(R,G,B)}{I}$$

$$H = \cos^{-1} \left[\frac{\frac{1}{2}[(R-G) + (R-B)]}{\sqrt{(R-G)^2 + (R-B)(G-B)}} \right]$$

4

Review: Z-Buffer Algorithm

- augment color framebuffer with **Z-buffer** or **depth buffer** which stores Z value at each pixel
 - at frame beginning, initialize all pixel depths to ∞
 - when rasterizing, interpolate depth (Z) across polygon
 - check Z-buffer before storing pixel color in framebuffer and storing depth in Z-buffer
 - don't write pixel if its Z value is more distant than the Z value already stored there

5

Clarification/Review: Depth Test Precision

- reminder: projective transformation maps eye-space z to generic z -range (NDC)

$$\begin{bmatrix} x_N \\ y_N \\ z_N \\ w_N \end{bmatrix} = \begin{bmatrix} \frac{2n}{r-l} & 0 & \frac{r+l}{r-l} & 0 \\ 0 & \frac{2n}{t-b} & \frac{t+b}{t-b} & 0 \\ 0 & 0 & \frac{-(f+n)}{f-n} & \frac{-2fn}{f-n} \\ 0 & 0 & -1 & 0 \end{bmatrix} \begin{bmatrix} x_E \\ y_E \\ z_E \\ w_E \end{bmatrix}$$

• thus $z_N \approx 1/z_E$

$$z_N = \frac{-(f+n)}{f-n} z_E + \frac{-2fn}{f-n} w_E, w_N = -z_E \quad \frac{z_N}{w_N} = \frac{f+n}{f-n} + \frac{2fn}{f-n} \frac{w_E}{z_E}$$

6

Backface Culling

7

Back-Face Culling

- not rendering backfacing polygons improves performance
 - by how much?
 - reduces by about half the number of polygons to be considered for each pixel
 - optimization when appropriate

9

Back-face Culling: VCS

10

Back-face Culling: NDCS

11

Back-Face Culling: Manifolds

- most objects in scene are typically "solid"
- specifically: **orientable closed manifolds**
 - **orientable**: must have two distinct sides
 - cannot self-intersect
 - a sphere is orientable since has two sides, 'inside' and 'outside'.
 - a Mobius strip or a Klein bottle is not orientable
 - **closed**: cannot "walk" from one side to the other
 - sphere is closed manifold
 - plane is not

Back-Face Culling: Manifolds

- most objects in scene are typically "solid"
- specifically: **orientable closed manifolds**
 - **manifold**: local neighborhood of all points isomorphic to disc
 - boundary partitions space into interior & exterior

13

Backface Culling: Manifolds

- examples of manifold objects:
 - sphere
 - torus
 - well-formed CAD part
- examples of non-manifold objects:
 - a single polygon
 - a terrain or height field
 - polyhedron w/ missing face
 - anything with cracks or holes in boundary
 - one-polygon thick lampshade

14

Invisible Primitives

- why might a polygon be invisible?
 - polygon outside the **field of view / frustum**
 - solved by **clipping**
 - polygon is **backfacing**
 - solved by **backface culling**
 - polygon is **occluded** by object(s) nearer the viewpoint
 - solved by **hidden surface removal**

15

Texturing

16

Rendering Pipeline

17

Texture Mapping

- real life objects have nonuniform colors, normals
- to generate realistic objects, reproduce coloring & normal variations = **texture**
- can often replace complex geometric details

18

Texture Mapping

- introduced to increase realism
 - lighting/shading models not enough
- hide geometric simplicity
 - images convey illusion of geometry
 - map a brick wall texture on a flat polygon
 - create bumpy effect on surface
- associate 2D information with 3D surface
 - point on surface corresponds to a point in texture
 - "paint" image onto polygon

19

Color Texture Mapping

- define color (RGB) for each point on object surface
- two approaches
 - surface texture map
 - volumetric texture

20

Texture Coordinates

- texture image: 2D array of color values (*texels*)
- assigning *texture coordinates* (s,t) at vertex with object coordinates (x,y,z,w)
 - use interpolated (s,t) for texel lookup at each pixel
 - use value to modify a polygon's color
 - or other surface property
 - specified by programmer or artist

21

Texture Mapping Example

22

Example Texture Map

23

Fractional Texture Coordinates

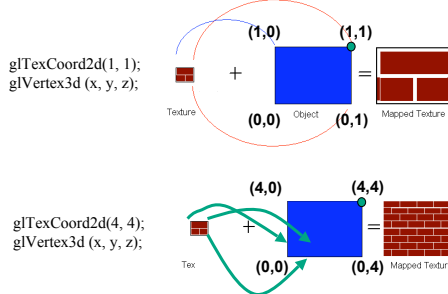

24

Texture Lookup: Tiling and Clamping

- what if s or t is outside the interval [0...1]?
- multiple choices
 - use fractional part of texture coordinates
 - cyclic repetition of texture to tile whole surface
 - clamp every component to range [0...1]
 - re-use color values from texture image border

25

Tiled Texture Map

27

Demo

- Nate Robbins tutors
 - texture

28

Texture Coordinate Transformation

- motivation
 - change scale, orientation of texture on an object
 - approach
 - *texture matrix stack*
 - transforms specified (or generated) tex coords
- ```

glMatrixMode(GL_TEXTURE);
glLoadIdentity();
glRotate();

```
- more flexible than changing (s,t) coordinates
  - [demo]

28

## Texture Functions

- once have value from the texture map, can:
  - directly use as surface color: `GL_REPLACE`
    - throw away old color, lose lighting effects
  - modulate surface color: `GL_MODULATE`
    - multiply old color by new value, keep lighting info
    - texturing happens **after** lighting, not **re**lit
  - use as surface color, modulate alpha: `GL_DECAL`
    - like replace, but supports texture transparency
  - blend surface color with another: `GL_BLEND`
    - new value controls which of 2 colors to use
    - indirection, new value not used directly for coloring
- specify with `glTexEnvf(GL_TEXTURE_ENV, GL_TEXTURE_ENV_MODE, <mode>)`
- [demo]

29

## Texture Pipeline

30

## Texture Objects and Binding

- texture object
  - an OpenGL data type that keeps textures resident in memory and provides identifiers to easily access them
  - provides efficiency gains over having to repeatedly load and reload a texture
  - you can prioritize textures to keep in memory
  - OpenGL uses least recently used (LRU) if no priority is assigned
- texture binding
  - which texture to use right now
  - switch between preloaded textures

31

## Basic OpenGL Texturing

- create a texture object and fill it with texture data:
  - `glGenTextures(num, &indices)` to get identifiers for the objects
  - `glBindTexture(GL_TEXTURE_2D, identifier)` to bind
    - following texture commands refer to the bound texture
  - `glTexParameteri(GL_TEXTURE_2D, ..., ...)` to specify parameters for use when applying the texture
  - `glTexImage2D(GL_TEXTURE_2D, ..., ...)` to specify the texture data (the image itself)
- enable texturing: `glEnable(GL_TEXTURE_2D)`
- state how the texture will be used:
  - `glTexEnvf(...)`
- specify texture coordinates for the polygon:
  - use `glTexCoord2f(s, t)` before each vertex:
    - `glTexCoord2f(0, 0); glVertex3f(x, y, z);`

32

## Low-Level Details

- large range of functions for controlling layout of texture data
  - state how the data in your image is arranged
  - e.g.: `glPixelStorei(GL_UNPACK_ALIGNMENT, 1)` tells OpenGL not to skip bytes at the end of a row
  - you must state how you want the texture to be put in memory: how many bits per "pixel", which channels,...
- textures must be square and size a power of 2
  - common sizes are 32x32, 64x64, 256x256
  - smaller uses less memory, and there is a finite amount of texture memory on graphics cards
- ok to use texture template sample code for project 4
  - <http://nehe.gamedev.net/data/lessons/lesson.asp?lesson=09>

33

## Texture Mapping

- texture coordinates
  - specified at vertices
    - `glTexCoord2f(s, t);`
    - `glVertexf(x, y, z);`
  - interpolated across triangle (like R,G,B,Z)
    - ...well not quite!

34

## Texture Mapping

- texture coordinate interpolation
  - perspective foreshortening problem

35

## Interpolation: Screen vs. World Space

- screen space interpolation incorrect
  - problem ignored with shading, but artifacts more visible with texturing

36

## Texture Coordinate Interpolation

- perspective correct interpolation
  - $\alpha, \beta, \gamma$ :
    - barycentric coordinates of a point P in a triangle
  - $s_0, s_1, s_2$ :
    - texture coordinates of vertices
  - $w_0, w_1, w_2$ :
    - homogeneous coordinates of vertices

$$s = \frac{\alpha \cdot s_0 / w_0 + \beta \cdot s_1 / w_1 + \gamma \cdot s_2 / w_2}{\alpha / w_0 + \beta / w_1 + \gamma / w_2}$$

37

## Reconstruction

(Image courtesy of Kiriakos Kutulakos, U Rochester)

38

## Reconstruction

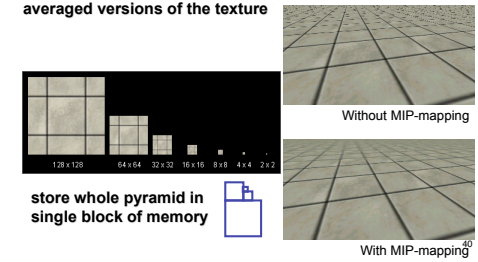

- how to deal with:
  - pixels that are much larger than texels?
    - apply filtering, "averaging"
  - pixels that are much smaller than texels?
    - interpolate

39

## MIPmapping

use "image pyramid" to precompute averaged versions of the texture

store whole pyramid in single block of memory

40

## MIPmaps

- **multum in parvo** -- many things in a small place
  - prespecify a series of prefiltered texture maps of decreasing resolutions
  - requires more texture storage
  - avoid shimmering and flashing as objects move
- `gluBuild2DMipmaps`
  - automatically constructs a family of textures from original texture size down to 1x1

41

## MIPmap storage

- only 1/3 more space required

42

## Texture Parameters

- in addition to color can control other material/object properties
  - surface normal (bump mapping)
  - reflected color (environment mapping)

43

## Bump Mapping: Normals As Texture

- object surface often not smooth -- to recreate correctly need complex geometry model
- can control shape "effect" by locally perturbing surface normal
  - random perturbation
  - directional change over region

44

## Bump Mapping

## Bump Mapping

45

## Embossing

- at transitions
  - rotate point's surface normal by  $\_$  or  $\_$

47

## Displacement Mapping

- bump mapping gets silhouettes wrong
  - shadows wrong too
- change surface geometry instead
  - only recently available with realtime graphics
  - need to subdivide surface

48

## Environment Mapping

- cheap way to achieve reflective effect
  - generate image of surrounding
  - map to object as texture

49

## Environment Mapping

- used to model object that reflects surrounding textures to the eye
  - movie example: cyborg in Terminator 2
- different approaches
  - sphere, cube most popular
    - OpenGL support
      - `GL_SPHERE_MAP`, `GL_CUBE_MAP`
  - others possible too

50

## Sphere Mapping

- texture is distorted fish-eye view
  - point camera at mirrored sphere
  - spherical texture mapping creates texture coordinates that correctly index into this texture map

51

## Cube Mapping

- 6 planar textures, sides of cube
  - point camera in 6 different directions, facing out from origin

52

## Cube Mapping

53

## Cube Mapping

- direction of reflection vector  $r$  selects the face of the cube to be indexed
  - co-ordinate with largest magnitude
    - e.g., the vector  $(-0.2, 0.5, -0.84)$  selects the  $-Z$  face
  - remaining two coordinates (normalized by the 3<sup>rd</sup> coordinate) selects the pixel from the face.
    - e.g.,  $(-0.2, 0.5)$  gets mapped to  $(0.38, 0.80)$ .
- difficulty in interpolating across faces

54

## Review: Texture Objects and Binding

- texture objects
  - texture management: switch with bind, not reloading
  - can prioritize textures to keep in memory
  - Q: what happens to textures kicked out of memory?
    - A: resident memory (on graphics card) vs. nonresident (on CPU)
    - details hidden from developers by OpenGL

55

## Volumetric Texture

- define texture pattern over 3D domain - 3D space containing the object
  - texture function can be digitized or procedural
  - for each point on object compute texture from point location in space
- common for natural material/irregular textures (stone, wood, etc...)

## Volumetric Bump Mapping

Marble

Bump

57

## Volumetric Texture Principles

- 3D function  $\rho$ 
  - $\forall \rho = \rho(x, y, z)$
- texture space – 3D space that holds the texture (discrete or continuous)
- rendering: for each rendered point  $P(x, y, z)$  compute  $\rho(x, y, z)$
- volumetric texture mapping function/space transformed with objects

58
