

# Statistical Analysis of Monthly Background Checks of Gun Purchases

Gregor Aisch, Josh Keller and Dirk Eddelbuettel

---

2019-09-03

---

## About

---

This document provides the analysis from the [New York Times](#) on-line article "[What Drives Gun Sales: Terrorism, Obama and Calls for Restrictions](#)". The [R](#) code underlying the analysis is provided in the [GitHub](#) repository [gunsales](#) which contains the R package

## Part I Data

---

The first step consists in transforming the two raw data sets included in the package into the data.frame used for the subsequent plotting.

```
gunsales <- analysis()
```

```
## [1] "Increase in monthly gun sales in Missouri = 8773.09"
```

## Part II: Base Plots

---

Given the transformed data, we can display the variety of plots contained in the New York Times analysis (which uses post-processed variants suitable for publication).

```
plot_gunsales(gunsales)
```

### Long guns vs handguns

red = handguns, blue = long guns

### New Jersey

pct of national gun sales

### Maryland

pct of national gun sales

### Georgia

pct of national gun sales

### Louisiana

pct of national gun sales

### Mississippi

pct of national gun sales

## Part III: Using ggplot

The second set of charts redisplay the same charts as before, but using the [ggplot2](#) package.

```
ggplot_gunsales(gunsales)
```

**Total estimated gun sales**

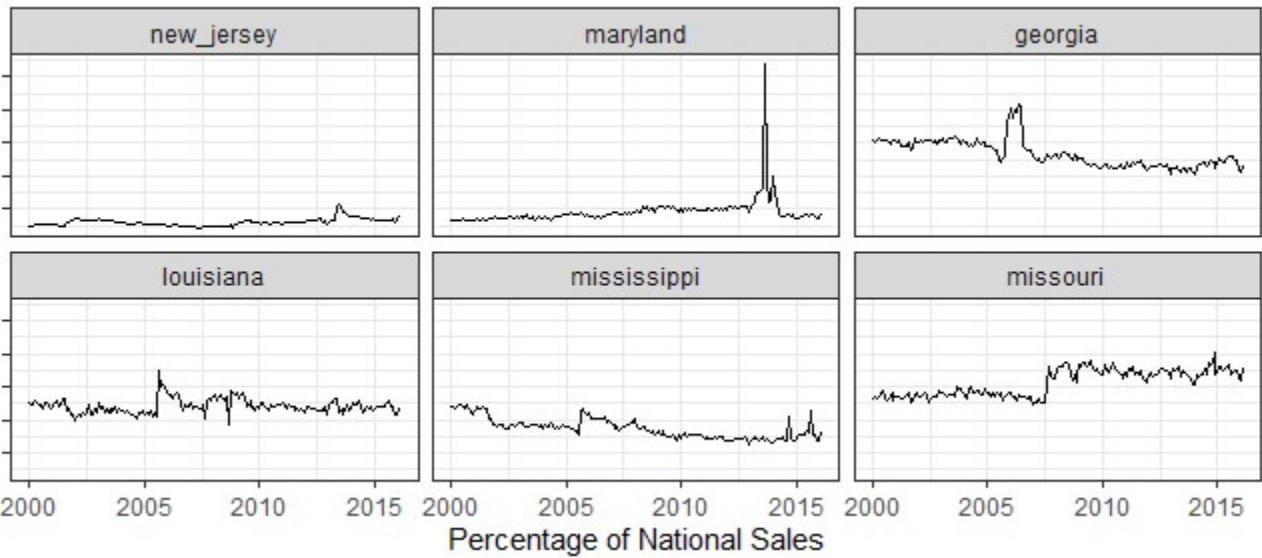

**Total estimated gun sales**

**Estimated gun sales per 1000**

### Long guns vs handguns

### Washington D.C.
