- Where are we?

Bnet Inference: General

- Suppose the variables of the belief network are $X_1, \ldots, X_n$.

- Z is the query variable

- $Y_1 = v_1, \ldots, Y_j = v_j$ are the observed variables (with their values)

- $Z_1, \ldots, Z_k$ are the remaining variables

- What we want to compute: $P(Z \mid Y_1 = v_1, \ldots, Y_j = v_j)$

- We can actually compute: $P(Z, Y_1 = v_1, \ldots, Y_j = v_j)$

$$P(Z \mid Y_1 = v_1, \ldots, Y_j = v_j) = \frac{P(Z, Y_1 = v_1, \ldots, Y_j = v_j)}{P(Y_1 = v_1, \ldots, Y_j = v_j)} = \frac{P(Z, Y_1 = v_1, \ldots, Y_j = v_j)}{\sum_Z P(Z, Y_1 = v_1, \ldots, Y_j = v_j)}$$

Inference with Factors

We can compute $P(Z, Y_1 = v_1, \ldots, Y_j = v_j)$ by

- expressing the joint as a factor,

$f(Z, \ Y_1 \ldots, Y_j, \ Z_1 \ldots, Z_j \ )$

- **assigning** $Y_1 = v_1, \ldots, Y_i = v_j$

- and **summing out** the variables $Z_1, \ldots, Z_k$

$$P(Z, Y_1 = v_1, \ldots, Y_j = v_j) = \sum_{Z_k} \cdots \sum_{Z_1} f(Z, Y_1, \ldots, Y_j, Z_1, \ldots, Z_k)_{Y_1 = v_1, \ldots, Y_j = v_j}$$

Variable Elimination Intro (1)

$$P(Z, Y_1 = v_1, \ldots, Y_j = v_j) = \sum_{Z_k} \cdots \sum_{Z_1} f(Z, Y_1, \ldots, Y_j, Z_1, \ldots, Z_k)_{Y_1 = v_1, \ldots, Y_j = v_j}$$

- Using the **chain rule** and the **definition of a Bnet**, we can write $P(X_1, \ldots, X_n)$ as $\prod_{i=1}^{n} P(X_i \mid pX_i)$

- We can express the joint factor as a product of factors

$$f(Z, \ Y_1 \ldots, Y_j, \ Z_1 \ldots, Z_j \ ) \qquad \prod_{i=1}^{n} f(X_i, pX_i)$$

$$P(Z, Y_1 = v_1, \ldots, Y_j = v_i) = \sum_{Z_k} \cdots \sum_{Z_1} \prod_{i=1}^{n} f(X_i, pX_i)_{Y_1 = v_1, \ldots, Y_j = v_j}$$

Variable Elimination Intro (2)

Inference in belief networks thus reduces to computing "the sums of products…."

$$P(Z, Y_1 = v_1, \ldots, Y_j = v_j) = \sum_{Z_k} \cdots \sum_{Z_1} \prod_{i=1}^{n} f(X_i, pX_i) \Big|_{Y_1 = v_1, \ldots, Y_j = v_j}$$
1. Construct a factor for each conditional probability.

2. In each factor assign the observed variables to their observed values.

3. Multiply the factors

4. For each of the other variables $Z_i \in \{Z_1, \ldots, Z_k\}$, sum out Z_i

Lecture Overview

- Recap Intro Variable Elimination

- Variable Elimination
  - Simplifications
  - Example
  - Independence

- Where are we?

How to simplify the Computation?

- Assume we have turned the CPTs into factors and performed the assignments

$$f(X_i, pX_i) \rightarrow f(\text{vars}X_i)$$

$P(C|DG)$ $\quad f(C, D, G)_{G=t} \rightarrow ?$ $\quad f(C, D)$

$$\sum_{Z_k} \cdots \sum_{Z_1} \prod_{i=1}^{n} f(X_i, pX_i)_{Y_1=v_1,\ldots,Y_j=v_j} \quad \Rightarrow \quad \sum_{Z_k} \cdots \sum_{Z_1} \prod_{i=1}^{n} f(\text{vars}X_i)$$

Let's focus on the basic case, for instance…

$$\sum_{A} f(C, D) \times f(A, B, D) \times f(E, A) \times f(D)$$

How to simplify: basic case

Let's focus on the basic case.

$$\sum_{Z_1} \prod_{i=1}^{n} f(\text{vars}X_i)$$

$$\sum_{A} f(C,D) \times f(A,B,D) \times f(E,A) \times f(D)$$

- How can we compute efficiently?

Factor out those terms that don't involve Z_1 !

$$\left(\prod_{i | Z_1 \notin \text{vars}X_i} f(\text{vars}X_i) \right) \times \left(\sum_{Z_1} \prod_{i | Z_1 \in \text{vars}X_i} f(\text{vars}X_i) \right)$$

do not contain Z_1 do contain

$$f(C,D) \times f(D) \times \sum_{A} f(A,B,D) \times f(E,A)$$

General case: Summing out variables efficiently

$$\sum_{Z_k} \cdots \sum_{Z_1} f_1 \times \cdots \times f_h = \sum_{Z_k} \cdots \sum_{Z_2} (f_1 \times \cdots \times f_i) \left(\sum_{Z_1} f_{i+1} \times \cdots \times f_h \right)$$

$$\sum_{Z_k} \cdots \sum_{Z_2} f_1 \times \cdots \times f_i \times \boxed{f'}$$

Now to sum out a variable Z_2 from a product $f_1 \times \dots \times f_i \times f'$ of factors, again partition the factors into two sets

- F̂: those that _contain Z_2_
- F: those that _do not_

$$\prod F \times \sum_{Z_2} \prod \hat{F}$$

Analogy with "Computing sums of products"

This simplification is similar to what you can do in basic algebra with *multiplication* and *addition*

• It takes *14* multiplications or additions to evaluate the expression

$$a\,b + a\,c + a\,d + a\,e\,h + a\,f\,h + a\,g\,h.$$

• This expression be evaluated more efficiently….

$$a*(b + c + d. + h*(e + f + g))$$ 7 operations

Variable elimination ordering

Is there only one way to simplify?

$P(G,D=t) = \sum_{A,B,C,} f(A,G)\, f(B,A)\, f(C,G)\, f(B,C)$

CBA

$P(G,D=t) = \sum_A f(A,G) \sum_B f(B,A) \sum_C f(C,G)\, f(B,C)$

BCA

$P(G,D=t) = \sum_A f(A,G) \sum_C f(C,G) \sum_B f(B,C)\, f(B,A)$

Variable elimination algorithm: Summary

$$P(Z, Y_1...,Y_j, Z_1...,Z_j)$$

To compute $P(Z| Y_1=v_1 ,... ,Y_j=v_j)$:

1. Construct a factor for each conditional probability.

2. Set the observed variables to their observed values.

3. Given an elimination ordering, simplify/decompose sum of products

4. Perform products and sum out Z_i

5. Multiply the remaining factors (all in ?

6. Normalize: divide the resulting factor $f(Z)$ by $\sum_Z f(Z)$.

A. $Y_1=v_1$ B. Y_2

C. Z_2 D. Z

Variable elimination algorithm: Summary

$$P(Z, Y_1 ..., Y_j, Z_1 ..., Z_j)$$

To compute $P(Z| Y_1=v_1, ..., Y_j=v_j)$:

1. Construct a factor for each conditional probability.

2. Set the observed variables to their observed values.

3. Given an elimination ordering, simplify/decompose sum of products

4. Perform products and sum out Z_i

5. Multiply the remaining factors (all in ? Z)

6. Normalize: divide the resulting factor $f(Z)$ by $\sum_Z f(Z)$.

Complexity (not required)

- The complexity of the algorithm depends on a measure of complexity of the network.

- The size of a tabular representation of a factor is exponential in the number of variables in the factor.

- The **treewidth** of a network, given an elimination ordering, is the maximum number of variables in a factor created by summing out a variable, given the elimination ordering.

- The **treewidth** of a belief network is the minimum treewidth over all elimination orderings. The treewidth depends only on the graph structure and is a measure of the sparseness of the graph.

- The complexity of VE is exponential in the treewidth and linear in the number of variables.

- Finding the elimination ordering with minimum treewidth is NP-hard, but there is some good elimination ordering heuristics.

Variable elimination and conditional independence

- Variable Elimination looks incredibly painful for large graphs?
- We used conditional independence…..

$$P(X_1 \ldots X_n) = \prod P(X_i \mid parents(X_i))$$

  - Can we use it to make variable elimination simpler?

Yes, all the variables from which the query is conditional independent given the observations can be pruned from the Bnet

VE and conditional independence: Example

- All the variables from which the query is conditional independent given the observations can be pruned from the Bnet

e.g., P(G | H=v₁, F= v₂, C=v₃).

$$e.g., P(G \mid H=v_1, F=v_2, C=v_3).$$
