Intelligent Systems (AI-2)

Computer Science cpsc422, Lecture 24

Nov, 6, 2015

Slide credit: Satanjeev Banerjee Ted Pedersen 2003, Jurfsky & Martin 2008

CPSC 422, Lecture 24

Lecture Overview

- Semantic Similarity/Distance
- Concepts: Thesaurus/Ontology Methods
- Words: Distributional Methods

WordNet: entry for "table"

The noun "table" has 6 senses in WordNet. × 1. table, tabular array -> (a set of data ...) > 2. table -- (a piece of furniture ...) > 3. table -- (a piece of furniture with tableware...) × 4. mesa, table -- (flat tableland ...) 5. table -- (a company of people ...) 6. board, table -- (food or meals ...)

The verb "table" has 1 sense in WordNet. 1. <u>postpone</u>, <u>prorogue</u>, <u>hold over</u>, <u>put ove</u>r, <u>table</u>, <u>shelve</u>, <u>set back</u>, <u>defer</u>, <u>remit</u>, <u>put off</u> - (hold back to a later time; "let's postpone the exam")

WordNet Relations (between synsets!) $\mathcal{N} \otimes \mathcal{V} \otimes \mathcal{V} \otimes \mathcal{V} \otimes \mathcal{V}$

Relation	Definition	Example
Hypernym	From concepts to superordinates	breakfast $ ightarrow$ meal
Hyponym	From concepts to subtypes	$meal \rightarrow lunch$
Has-Member	From groups to their members	faculty $ ightarrow$ professor
Member-Of	From members to their groups	copilot ightarrow crew
Has-Part	From wholes to parts	table ightarrow leg
Part-Of	From parts to wholes	course ightarrow meal
Antonym	Opposites	leader $ ightarrow$ follower

Verbs			
Relation	Definition	Example	
Hypernym	From events to superordinate events	$fly \rightarrow travel$	
Troponym	From events to their subtypes	walk \rightarrow stroll	
Entails	From events to the events they entail	$snore \rightarrow sleep$	
Antonym	Opposites	increase \iff decrease	

Visualizing Wordnet Relations

C. Collins, "WordNet Explorer: Applying visualization principles to lexical semantics," University of Toronto, Technical Report kmdi 2007-2, 2007.

CPSC 422, Lecture 24

Semantic Similarity/Distance: example

(n) table -- (a piece of furniture having a smooth flat top that is usually supported by one or more vertical legs)

(n) mesa, table --(flat tableland with steep edges)

(n) hill (a local and welldefined elevation of the land)

(n) lamp (a piece of furniture holding one or more electric light bulbs)

discimilar

SIM

Semantic Similarity/Distance

Between two concepts in an ontology, e.g., between two senses in Wordnet What would you use to compute it ?

A. The distance between the two concepts in the underlying hierarchies / graphs

B. The glosses of the concepts

C. None of the above

iclicker.

Gloss Overlaps ~ Relatedness

- Lesk's (1986) idea: Related word senses are (often) defined using the same words. E.g.
 - bank(1): "a financial institution"
 - bank(2): "sloping land beside a body of water"
 - Iake: "a body of water surrounded by land"

Gloss Overlaps \approx Relatedness

- Lesk's (1986) idea: Related word senses are (often) defined using the same words. E.g.
 - bank(1): "a financial institution"
 - bank(2): "sloping <u>land</u> beside a <u>body</u> of <u>water</u>"
 - Iake: "a <u>body</u> of <u>water</u> surrounded by <u>land</u>"

Gloss Overlaps \approx Relatedness

- Lesk's (1986) idea: Related word senses are (often) defined using the same words. E.g.
 - bank(1): "a financial institution"
 - bank(2): "sloping <u>land</u> beside a <u>body</u> of <u>water</u>"
 - Iake: "a <u>body</u> of <u>water</u> surrounded by <u>land</u>"
- Gloss overlaps = # content words common to two glosses ≈ relatedness
 - Thus, relatedness (bank(2), lake) = 3
 - And, relatedness (bank(1), lake) = 0

Limitations of (Lesk's) Gloss Overlaps

Most glosses are very short.

So not enough words to find overlaps with.

Solution?
Extended gloss overlaps
Add glosses of synsets connected to the input synsets.

Extending a Gloss

sentence: "the penalty meted out to one adjudged guilty" **bench**: "persons who hear cases in a court of law"

overlapped words = 0

Extending a Gloss

overlapped words = 0

Extending a Gloss

overlapped words = 2

Creating the Extended Gloss Overlap Measure

How to measure overlaps?

Which relations to use for gloss extension?

How to Score Overlaps?

- Lesk simply summed up overlapped words.
- But matches involving phrases phrasal matches – are rarer, and more informative
 - E.g. "court of law" "body of water"
- Aim: Score of n words in a phrase > sum of scores of *n* words in shorter phrases
- Solution: Give a phrase of *n* words a score of n^2
 - "court of law" gets score of 9.
 - bank(2): "sloping <u>land</u> beside a <u>body of water</u>" 9+1=10
 - Iake: "a body of water surrounded by land"

Which Relations to Use?

- Typically include...
- ► Hypernyms ["car" \rightarrow "vehicle"]
- ► Hyponyms ["car" \rightarrow "convertible"]
- Meronyms ["car" → "accelerator"]
- ► Holonym ["car" → "train"]

Extended Gloss Overlap Measure

Input two synsets A and B

- Find phrasal gloss overlaps between A and B
- For each relation, compute phrasal gloss overlaps between every synset connected to A, and every synset connected to B

compute phrasal score over lap

Add phrasal scores to get relatedness of A and B A and B can be from different parts of speech!

Distance: Path-length

Path-length sim based on is-a/hypernyms hierarchies

$$sim_{path}(c_1, c_2) = 1/pathlen(c_1, c_2)$$

61

But this is assuming that all the links are the same.... Encode the same semantic distance....

 Similarity should be proportional to the information that the two concepts share... what is that?

$$\sin_{\text{resnik}}(c_1, c_2) = -\log P(LCS(c_1, c_2))$$

CPSC 422, Lecture 24

- One of best performers Jiang-Conrath distance
- How much information the two DO NOT share

CPSC 422, Lecture 24

- One of best performers Jiang-Conrath distance
- How much information the two DO NOT share

 $dist_{JC}(c_1, c_2) = ((-\log P(c_1)) + (-\log P(c_2))) - (2 \times -\log P(LCS(c_1, c_2)))$

 $dist_{JC}(c_1, c_2) = 2 \times \log P(LCS(c_1, c_2)) - (\log P(c_1) + \log P(c_2))$

- This is a measure of distance. Reciprocal for similarity!
- Problem for measures working on hierarchies/graphs: only compare concepts associated with words of part part-of speech (typically nouns)
 CPSC 422, Lecture 24

- One of best performers Jiang-Conrath distance
- How much information the two DO NOT share

- This is a measure of distance. Reciprocal for similarity! $\frac{1}{3}$
- Problem for measures working on hierarchies/graphs: only compare concepts associated with words of part part-of speech (typically nouns)
 CPSC 422, Lecture 24

Best Performers

- Jiang-Conrath
- Extended Lesk

• Wordnet::Similarity Package Pedersen et al. 2004 ACL (also in NLTK)

Lecture Overview

- Semantic Similarity/Distance
- Concepts: Thesaurus/Ontology Methods
- Words: Distributional Methods Word Similarity (WS)

Word Similarity: Distributional Methods

- Do not have any thesauri/ontologies for target language (e.g., Russian)
- If you have thesaurus/ontology, still
 - Missing domain-specific (e.g., technical words)
 - Poor hyponym knowledge (for V) and nothing for Adj and Adv
 - Difficult to compare senses from different hierarchies (although extended Lesk can do this)
 - Solution: extract similarity from corpora
 - Basic idea: two words are similar if they appear in similar contexts

WS Distributional Methods (1)

Context: feature vector

$$\vec{w} = (f_1, f_2, ..., f_N) \rightarrow w_1 \rightarrow w_2 \qquad w_3 \rightarrow w_4 \qquad w_4 \rightarrow w_4$$

Stop list

WS Distributional Methods (2)

- More informative values (referred to as weights or measure of association in the literature)
 - Point-wise Mutual Information $\mathcal{P}(\mathcal{W})$

$$assoc_{PMI}(w, w_i) = \log_2 \underbrace{\frac{P(w, w_i)}{P(w)P(w_i)}}_{P(w)P(w_i)}$$

t-test
$$assoct_{t-test}(w, w_i) = \frac{P(w, w_i) - P(w)P(w_i)}{\sqrt{P(w)P(w_i)}} \underbrace{\sqrt{P(w)P(w_i)}}_{N_{31}}$$

PMI example
Assome
$$w, w_{i} = \log_{2} \frac{P(w, w_{i})}{P(w)P(w_{i})}$$

Assome $w, w_{i} = 2^{-10}$
 $P(w) = 2^{-10}$
 $P(w_{i}) = 2$

A 2550CPMI =
$$\log_2 \frac{2^{-20}}{2^{-10} \times 2^{-10}} = \log_2 1 = 0$$

B 3550CPMI = $\log_2 \frac{2^{-10} \times 2^{-10}}{2^{-10} \times 2^{-10}} = \log_2 2^{10} = 10$

CPSC 422, Lecture 24

WS Distributional Methods (3)

Similarity between vectors

WS Distributional Methods (4)

- Best combination overall (Curan 2003)
 t-test for weights
 - Jaccard (or Dice) for vector similarity

Learning Goals for today's class

You can:

- Describe and Justify metrics to compute the similarity/distance of two concepts in an ontology
- Describe and Justify distributional metrics to compute the similarity/distance of two words (or phrases) in a Natural Language

Next class Mon: Paper Discussion

Carenini G., Ng R., Zwart E., Extracting Knowledge from Evaluative Text, 3rd *International Conference on Knowledge Capture* (KCAP 2005). Banff, Canada. October 2-5, 2005.

Assignment-3 out - due Nov 20
Sim/Distance: from concepts to words

If we do not have

Word Sense Disambiguation

word
$$sim(w_1, w_2) = M\partial X$$
 $sim(C_{1}, C_2)$
 $C_1 \in Senses(w_1)$
 $C_2 \in Senses(w_2)$

1

WordSim: Thesaurus Methods(Extended Lesk)

 For each n-word phrase that occurs in both glosses, Extended Lesk adds in a score n²

CPSC 422, Lecture 24

Semantic Similarity/Distance

Between two concepts in an ontology, e.g., between two senses in Wordnet

What would you use

- Thesaurus methods: measure distance in online thesauri (e.g., Wordnet)
- Distributional methods: finding if the two words appear in similar contexts

WDS: Dictionary and Thesaurus Methods

Most common: Lesk method

- Choose the sense whose dictionary gloss shares most words with the target word's neighborhood
- · Exclude stop-words we move the toble

Def: Words in gloss for a sense is called the *signature*

Lesk: Example

Two SENSES for channel

S1: (n) **channel** (a passage for water (or other fluids) to flow through) "the fields were crossed with irrigation channels"; "gutters carried off the rain water into a series of channels under the street"

S2: (n) **channel**, **television channel**, **TV channel** (a television station and its programs) "*a satellite TV channel*"; "*surfing through the channels*"; "*they offer more than one hundred channels*"

"most streets closed to the TV station were flooded because the main **channel** was clogged by heavy rain."

Corpus Lesk

Best performer

- If a corpus with annotated senses is available
- For each sense: add to the signature for that sense, words "that frequently appear" in the sentences containing that sense

CORPUS

• • • • • •

.

"most streets closed to the TV station were flooded because the main $\langle S1 \rangle$ channel $\langle /S1 \rangle$ was clogged by heavy rain.

Word Similarity/Semantic Distance

Actually relation between two senses sun vs. moon - mouth vs. food - hot vs. cold

Applications?

- Thesaurus methods: measure distance in online thesauri (e.g., Wordnet)
- Distributional methods: finding if the two words appear in similar contexts

WS: Thesaurus Methods(1)

Path-length based sim on hyper/hypo hierarchies

$$sim_{path}(c_1, c_2) = -\log pathlen(c_1, c_2)$$

Information content word similarity (not all edges are equal)

probability
$$\sum_{\substack{c_i \in subsense(c) \\ N}} count(c_i) = \frac{C_i \in subsense(c)}{N}$$

$$IC(c) = -\log P(c) \qquad LCS(c_1, c_2)$$
Information Lowest Common Subsumer

$$sim_{resnik}(c_1, c_2) = -\log P(LCS(c_1, c_2))$$

Ontologies

Given a logical representation (e.g., FOL) What individuals and relations are there and we need to model?

In AI an **Ontology** is a specification of what individuals and relationships are assumed to exist and what terminology is used for them

- What **types** of individuals
- What **properties** of the individuals

Ontologies: inspiration from Natural Language

How do we refer to individuals and relationship in the world in NL e.g., English? words

Where do we find definitions for words? Dictionary Most of the definitions are circular? They are descriptions. Red $\angle B | oog |$

Fortunately, there is still some useful semantic info (Lexical Relations):

 $w_1 w_2$ same Form and Sound, different Meaning Homonymy $w_1 w_2$ same Meaning, different Form Synonymy big large $w_1 w_2$ "opposite" Meaning Antonymy good/bod $w_1 w_2$ Meaning₁ subclass of Meaning₂ Hyponymy dog low mod

Polysemy

Def. The case where we have a set of words with the same form and multiple related meanings.

Consider the homonym:

bank \rightarrow commercial **bank**₁ vs. river **bank**₂

- Now consider: "A PCFG can be trained using derivation trees from a tree bank annotated by human experts"
 - Is this a new independent sense of bank?

Synonyms

Def. Different words with the same meaning.

Substitutability- if they can be substituted for one another in *some* environment without changing meaning or acceptability.

Would I be flying on a large/big plane?

- ?... became kind of a large/big sister to...
- ? You made a large/big mistake

Hyponymy

Def. Pairings where one word denotes a subclass of the other

Since dogs are canids
 Dog is a *hyponym* of canid and
 Canid is a *hypernym* of dog

car/vehicle doctor/human

.

Lexical Resources

Databases containing all lexical relations among all words

- Development:
 - Mining info from dictionaries and thesauri
 - Handcrafting it from scratch
- WordNet: fist developed with reasonable coverage and widely used, started with [Fellbaum... 1998]
 - for English (versions for other languages have been developed - see MultiWordNet)

WordNet 3.0

POS	Unique Strings	Synsets	Word-Sense Pairs
Noun	117798	82115	146312
Verb	11529	13767	25047
Adjective	21479	18156	30002
Adverb	4481	3621	5580
Totals	155287	117659	206941

- For each word: all possible senses (no distinction between homonymy and polysemy)
- For each sense: a set of synonyms (synset) and a gloss

WordNet: entry for "table"

The noun "table" has 6 senses in WordNet. × 1. table, tabular array -> (a set of data ...) > 2. table -- (a piece of furniture ...) > 3. table -- (a piece of furniture with tableware...) × 4. mesa, table -- (flat tableland ...) 5. table -- (a company of people ...) 6. board, table -- (food or meals ...)

The verb "table" has 1 sense in WordNet. 1. <u>postpone</u>, <u>prorogue</u>, <u>hold over</u>, <u>put ove</u>r, <u>table</u>, <u>shelve</u>, <u>set back</u>, <u>defer</u>, <u>remit</u>, <u>put off</u> - (hold back to a later time; "let's postpone the exam")

WordNet Relations (between synsets!) N

Relation	De finition	Example
Hypernym	From concepts to superordinates	$\underline{breakfast} ightarrow meal$
Hyponym	From concepts to subtypes	meal ightarrow lunch
Has-Member	From groups to their members	faculty $ ightarrow$ professor
Member-Of	From members to their groups	copilot ightarrow crew
Has-Part	From wholes to parts	table ightarrow leg
Part-Of	From parts to wholes	course ightarrow meal
Antonym	Opposites	leader $ ightarrow$ follower

Relation	Definition	Example
Hypernym	From events to superordinate events	$fly \rightarrow travel$
Troponym	From events to their subtypes	walk \rightarrow stroll
Entails	From events to the events they entail	$snore \rightarrow sleep$
Antonym	Opposites	increase \iff decrease

WordNet Hierarchies: "Vancouver"

Wordnet: NLP Tasks

- First success in Probabilistic Parsing (PPattachments): words + word-classes extracted from the hypernym hierarchy increase accuracy from 84% to 88% [Stetina and Nagao, 1997]
- Word sense disambiguation
- Lexical Chains (summarization)
- and *many others* !

More importantly starting point for larger Ontologies!

More ideas from NLP....

Relations among words and their meanings (paradigmatic)

Internal structure of individual words (syntagmatic)

Predicate-Argument Structure

 Represent relationships among concepts, events and their participants

"I ate a turkey sandwich for lunch" ∃ w: Isa(w,Eating) ∧ Eater(w,Speaker) ∧ Eaten(w,TurkeySandwich) ∧ MealEaten(w,Lunch)

"Nam does not serve meat"

∃ w: Isa(w,Serving) ∧ Server(w, Nam) ∧ ¬Served(w,Meat)

Semantic Roles: Resources

Move beyond inferences about single verbs

" IBM hired John as a CEO "

" John is the new IBM hire "

" IBM signed John for 2M\$"

- FrameNet: Databases containing frames and their syntactic and semantic argument structures
- (book online Version 1.5-update Sept, 2010)
 - for English (versions for other languages are under development)

FrameNet Entry

- Definition: An Employer hires an Employee, promising the Employee a certain Compensation in exchange for the performance of a job. The job may be described either in terms of a Task or a Position in a Field.
- Inherits From: Intentionally affect

Hiring

• Lexical Units: commission.n, commission.v, give job.v, hire.n, hire.v, retain.v, sign.v, take on.v

FrameNet Annotations

Some roles.. Employee Task Position

- np-vpto
 - In 1979 , singer Nancy Wilson HIRED him to open her nightclub act .
- np-ppas
 - Castro has swallowed his doubts and HIRED
 Valenzuela as a cook in his small restaurant .

Includes counting: How many times a role was expressed with a particular syntactic structure...

Lecture Overview

- **Ontologies** what objects/individuals should we represent? what relations (unary, binary,..)?
- Inspiration from Natural Language: WordNet and FrameNet
- Extensions based on Wikipedia and mining the Web (YAGO, ProBase, Freebase)
- Domain Specific Ontologies (e.g., Medicine: MeSH, UMLS)

YAGO2: huge semantic knowledge base

- Derived from **Wikipedia**, **WordNet** and **GeoNames**. (started in 2007, paper in www conference)
- 10⁶ entities (persons, organizations, cities, etc.)
- >120* 10⁶ facts about these entities.
 - YAGO accuracy of 95%. has been manually evaluated.
 - Anchored in time and space. YAGO attaches a temporal dimension and a spatial dimension to many of its facts and entities.

Probase (MS Research)

- Harnessed from billions of web pages and years worth of search logs
- Extremely large concept/category space (2.7 million categories).
- Probabilistic model for correctness, typicality (e.g., between concept and instance)

Infrastructure

Slide 65

A snippet of Probase's core taxonomy

Frequency distribution of the 2.7 million concepts

Freebase

- "Collaboratively constructed database."
- Freebase contains tens of millions of topics, thousands of types, and tens of thousands of properties and over a billion of facts
- Automatically extracted from a number of resources including Wikipedia, MusicBrainz, and NNDB
- as well as the knowledge contributed by the human volunteers.
- Each Freebase entity is assigned a set of humanreadable unique keys, which are assembled of a value and a namespace.
- All available for free through the APIs or to download from our weekly data dumps

Lecture Overview

- **Ontologies** what objects/individuals should we represent? what relations (unary, binary,..)?
- Inspiration from Natural Language: WordNet and FrameNet
- Extensions based on Wikipedia and mining the Web (YAGO, ProBase, Freebase)
- Domain Specific Ontologies (e.g., Medicine: MeSH, UMLS)

Domain Specific Ontologies: UMLS, MeSH

- Unified Medical Language System: brings together many health and biomedical vocabularies
- Enable interoperability (linking medical terms, drug names)
- Develop electronic health records, classification tools
- Search engines, data mining

Portion of the UMLS Semantic Net

CPSC 422, Lecture 24

WSD: More Recent Trends SemEval workshops -Cross Language Evaluation Forum (CLEF)

- Better ML techniques (e.g., Combining Classifiers)
- Combining ML and Lesk (Yuret, 2004)
- Other Languages
- Building better/larger corpora
State-of-the-art systems and current literature
