Proofs

- A proof is a mechanically derivable demonstration that a formula logically follows from a knowledge base.
- Given a proof procedure, $KB \vdash g$ means g can be derived from knowledge base KB.
- Recall $KB \models g$ means g is true in all models of KB.

Definition (soundness)

A proof procedure is sound if $KB \vdash g$ implies $KB \models g$.

Definition (completeness)

A proof procedure is complete if $KB \models g$ implies $KB \vdash g$.

Bottom-up Ground Proof Procedure

One rule of derivation, a generalized form of modus ponens: If " $h \leftarrow b_1 \land \ldots \land b_m$ " is a clause in the knowledge base, and each b_i has been derived, then h can be derived.

You are forward chaining on this clause. (This rule also covers the case when m = 0.)

医下颌 医下颌

Bottom-up proof procedure

$KB \vdash g$ if $g \subseteq C$ at the end of this procedure:

 $C := \{\};$ repeat
select clause " $h \leftarrow b_1 \land \ldots \land b_m$ " in KB such that $b_i \in C$ for all i, and $h \notin C$; $C := C \cup \{h\}$ until no more clauses can be selected.

$$a \leftarrow b \land c.$$

$$a \leftarrow e \land f.$$

$$b \leftarrow f \land k.$$

$$c \leftarrow e.$$

$$d \leftarrow k.$$

$$e.$$

$$f \leftarrow j \land e.$$

$$f \leftarrow c.$$

$$j \leftarrow c.$$

Soundness of bottom-up proof procedure

If $KB \vdash g$ then $KB \models g$.

- Suppose there is a g such that $KB \vdash g$ and $KB \not\models g$.
- Let h be the first atom added to C that's not true in every model of KB.
- Suppose h isn't *true* in model I of KB.
- There must be a clause in *KB* of form

$$h \leftarrow b_1 \land \ldots \land b_m$$

Each b_i is true in I. h is false in I. So this clause is false in I.

• Therefore *I* isn't a model of *KB*. Contradiction: thus no such *g* exists.

Minimal Model

We can use proof procedure to find a model of KB.

- First, observe that the *C* generated at the end of the bottom-up algorithm is a fixed point.
 - further applications of our rule of derivation will not change C.

▲ 理 ▶ | ▲ 理 ▶ …

Minimal Model

We can use proof procedure to find a model of KB.

- First, observe that the C generated at the end of the bottom-up algorithm is a fixed point.
 - further applications of our rule of derivation will not change C.

Definition (minimal model)

Let the minimal model I be the interpretation in which every element of the fixed point C is true and every other atom is false.

< ≞ > < ≞ > ...

Minimal Model

We can use proof procedure to find a model of KB.

- First, observe that the C generated at the end of the bottom-up algorithm is a fixed point.
 - further applications of our rule of derivation will not change C.

Definition (minimal model)

Let the minimal model I be the interpretation in which every element of the fixed point C is true and every other atom is false.

Claim: I is a model of KB. Proof:

- Assume that I is not a model of KB. Then there must exist some clause h ← b₁ ∧ ... ∧ b_m in KB (having zero or more b_i's) which is false in I.
- This can only occur when h is false and each b_i is true in I.
- If each b_i belonged to C, we would have added h to C as well.
- Since C is a fixed point, no such I can exist.

Completeness

If $KB \models g$ then $KB \vdash g$.

- Suppose $KB \models g$. Then g is true in all models of KB.
- Thus g is true in the minimal model.
- Thus g is generated by the bottom up algorithm.
- Thus $KB \vdash g$.
