## CS542G - Breadth in Scientific Computing

cs542g-term1-2006 1

## Web

---

- ◆ [www.cs.ubc.ca/~rbridson/courses/542g](http://www.cs.ubc.ca/~rbridson/courses/542g)
- ◆ Course schedule
  - Slides online, but you need to take notes too!
- ◆ Reading
  - There is an optional text, Heath
  - Relevant papers as we go
- ◆ Assignments + Final Exam information
  - Look for Assignment 1
- ◆ Resources

cs542g-term1-2006 2

---

## Contacting Me

- ◆ Robert Bridson
  - X663 (new wing of CS building)
  - Drop by, or make an appointment (safer)
  - 604-822-1993 (or just 21993)
  - email [rbridson@cs.ubc.ca](mailto:rbridson@cs.ubc.ca)
- ◆ I always like feedback!
  - Ask questions if I go too fast...

cs542g-term1-2006 3

---

## Evaluation

- ◆ ~4 assignments (40%)
- ◆ Final exam (60%)

cs542g-term1-2006 4

---

## MATLAB

- ◆ Tutorial Sessions at UBC
- ◆ Aimed at students who have not previously used Matlab.
- ◆ Wed. Sept. 13, 9 - 10am, ICICS/CS x250.
- ◆ Wed. Sept. 13, 5 - 6pm, DMP 301.  
[www.cs.ubc.ca/~mitchell/matlabResources.html](http://www.cs.ubc.ca/~mitchell/matlabResources.html)

cs542g-term1-2006 5

---

## Units

- ◆ Floating Point
- ◆ Interpolation/approximation, dense linear algebra
- ◆ ODE's and time integration, tree methods
- ◆ Mesh generation, Poisson equation, sparse linear algebra
- ◆ Hyperbolic PDE's

cs542g-term1-2006 6

# Floating Point

---

cs542g-term1-2006 7

# Numbers

---

- ◆ Fixed Point
  - Can be very fast, but limited range - dangerous
- ◆ Arbitrary Precision Arithmetic
  - Tends to be very slow
  - Occasionally very useful in simple Extended Precision
- ◆ Interval Arithmetic
  - Track bounds on error with every operation
  - Slower
- ◆ Floating Point
  - Usually the best mix of speed and safety

cs542g-term1-2006 8

# Floating Point Basics

---

- ◆ Sign, Mantissa, Exponent
- ◆ Epsilon
- ◆ Rounding
- ◆ Absolute Error vs. Relative Error

cs542g-term1-2006 9

# IEEE Floating Point

---

- ◆ 32-bit and 64-bit versions defined
- ◆ Most modern hardware implements the standard
  - But Java gets it wrong
  - GPU's etc. often simplify for speed
- ◆ Designed to be as safe/accurate/controlled as possible

cs542g-term1-2006 10

# IEEE Special Numbers

---

- ◆ +/- infinity
  - When you divide 1/0 for example, or  $\log(0)$
  - Can handle some operations consistently
  - Instantly slows down your code
- ◆ NaN (Not a Number)
  - The result of an undefined operation e.g.  $0/0$
  - Any operation with a NaN gives a NaN
    - Clear traceable failure deemed better than silent "graceful" failure!
  - $\text{Nan} \neq \text{NaN}$

cs542g-term1-2006 11

# Cancellation

---

- ◆ The single biggest issue in fp arithmetic
- ◆ Example:
  - Exact arithmetic:  
 $1.489106 - 1.488463 = 0.000643$
  - 4 significant digits in operation:  
 $1.489 - 1.488 = 0.001$
  - Result only has one significant digit (if that)
- ◆ When close numbers are subtracted, significant digits cancel, left with bad relative error
- ◆ Absolute error is still fine...

cs542g-term1-2006 12

## Cancellation Example 1

---

- ◆ Can sometimes be easily cured
- ◆ For example, solving quadratic  $ax^2+bx+c=0$  with real roots

cs542g-term1-2006 13

## Cancellation Example 2

---

- ◆ Sometimes not obvious to cure
- ◆ Estimate the derivative an unknown function

cs542g-term1-2006 14

## Accumulation

---

- ◆  $2+\text{eps}=2$
- ◆  $(2+\text{eps})+\text{eps}=2$
- ◆  $((2+\text{eps})+\text{eps})+\text{eps}=2$
- ◆ ...
- ◆ Add any number of eps to 2, always get 2
- ◆ But if we add the eps first, then add to 2, we get a more accurate result

cs542g-term1-2006 15

## Exact numbers in fp

---

- ◆ Integers (up to the range of the mantissa) are exact
- ◆ Those integers times a power of two (up to the range of the exponent) are exact
- ◆ Other numbers are rounded
  - Simple fractions  $1/3$ ,  $1/5$ ,  $0.1$ , etc.
  - Very large integers

cs542g-term1-2006 16

## Hardware

---

- ◆ Vectorization, ILP
- ◆ Separate fp / int pipelines
- ◆ Caches, prefetch
- ◆ Multi-processors
  
- ◆ Slow code:
- ◆ Fast code:
- ◆ Use good libraries when you can!

cs542g-term1-2006 17
