Arrange networks and trees

- Node-link Diagrams**
Connections and Marks
 NETWORKS TREES
- Adjacency Matrix**
Derived Table
 NETWORKS TREES
- Enclosure**
Containment Marks
 NETWORKS TREES

Idiom: force-directed placement

- visual encoding
 - link connection marks, node point marks
- considerations
 - spatial position: no meaning directly encoded
 - left free to minimize crossings
 - proximity semantics?
 - sometimes meaningful
 - sometimes arbitrary, artifact of layout algorithm
 - tension with length
 - long edges more visually salient than short
- tasks
 - explore topology; locate paths, clusters
- scalability
 - node/edge density $E < 4N$

<http://imbostock.github.com/d3.js/force.html>

Idiom: sfdp (multi-level force-directed placement)

- data
 - original: network
 - derived: cluster hierarchy atop it
- considerations
 - better algorithm for same encoding technique
 - same: fundamental use of space
 - hierarchy used for algorithm speed/quality but not shown explicitly
 - (more on algorithm vs encoding in afternoon)
- scalability
 - nodes, edges: 1K-10K
 - hairball problem eventually hits

[Efficient and high quality force-directed graph drawing. Hu. The Mathematica Journal 10:37-71, 2005.]

<http://www.research.att.com/~ofn/hu/GALLERY/GRAPHS/index1.html>

Idiom: adjacency matrix view

- data: network
 - transform into same data/encoding as heatmap
- derived data: table from network
 - 1 quant attrib
 - weighted edge between nodes
 - 2 categ attribs: node list x 2
- visual encoding
 - cell shows presence/absence of edge
- scalability
 - 1K nodes, 1M edges

[NodeTrix: a Hybrid Visualization of Social Networks. Henry Fekete, and McGuffin. IEEE TVCG (Proc. InfoVis) 13(6):1302-1309, 2007.]

[Points of view: Networks. Gehlenborg and Wang. Nature Methods 9:115.]

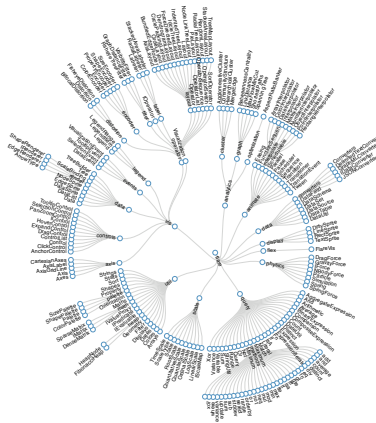

Connection vs. adjacency comparison

- adjacency matrix strengths
 - predictability, scalability, supports reordering
 - some topology tasks trainable
 - node-link diagram strengths
 - topology understanding, path tracing
 - intuitive, no training needed
 - empirical study
 - node-link best for small networks
 - matrix best for large networks
 - if tasks don't involve topological structure!
- [On the readability of graphs using node-link and matrix-based representations: a controlled experiment and statistical analysis. Ghoniem, Fekete, and Castagliola. Information Visualization 4:2 (2005), 114-135.]

Idiom: radial node-link tree

- data
 - tree
- encoding
 - link connection marks
 - point node marks
 - radial axis orientation
 - angular proximity: siblings
 - distance from center: depth in tree
- tasks
 - understanding topology, following paths
- scalability
 - 1K - 10K nodes

<http://imbostock.github.com/d3.js/tree.html>

Idiom: treemap

- data
 - tree
 - 1 quant attrib at leaf nodes
- encoding
 - area containment marks for hierarchical structure
 - rectilinear orientation
 - size encodes quant attrib
- tasks
 - query attribute at leaf nodes
- scalability
 - 1M leaf nodes

http://tulp.libri.fr/Documentation/3_7/userHandbook/html/ch06.html

Link marks: Connection and Containment

- marks as links (vs. nodes)
 - common case in network drawing
 - 1D case: connection
 - ex: all node-link diagrams
 - emphasizes topology, path tracing
 - networks and trees
 - 2D case: containment
 - ex: all treemap variants
 - emphasizes attribute values at leaves (size coding)
 - only trees

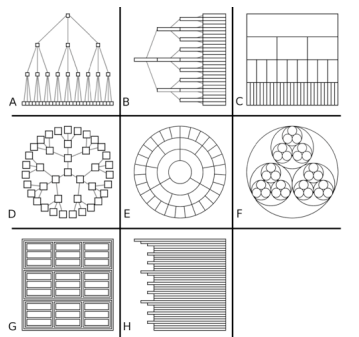

Containment Connection

Node-Link Diagram Treemap

[Elastic Hierarchies: Combining Treemaps and Node-Link Diagrams. Dong, McGuffin, and Chignell. Proc. InfoVis 2005, p. 57-64.]

Tree drawing idioms comparison

- data shown
 - link relationships
 - tree depth
 - sibling order
 - design choices
 - connection vs containment link marks
 - rectilinear vs radial layout
 - spatial position channels
 - considerations
 - redundant? arbitrary?
 - information density?
 - avoid wasting space
- [Quantifying the Space-Efficiency of 2D Graphical Representations of Trees. McGuffin and Robert. Information Visualization 9:2 (2010), 115-140.]

Idiom: GrouseFlocks

- data: compound graphs
 - network
 - cluster hierarchy atop it
 - derived or interactively chosen
- visual encoding
 - connection marks for network links
 - containment marks for hierarchy
 - point marks for nodes
- dynamic interaction
 - select individual metanodes in hierarchy to expand/contract

Topological Fisheye Views

- derived data
 - input: laid-out network (spatial positions for nodes)
 - output: multilevel hierarchy from graph coarsening
- interaction
 - user changed selected focus point
- visual encoding
 - hybrid view made from cut through several hierarchy levels

[Fig 4.7. Topological Fisheye Views for Visualizing Large Graphs. Gansner, Koren and North, IEEE TVCG 11(4), p 457-468, 2005]

Topological Fisheye Views

- derived data
 - input: laid-out network (spatial positions for nodes)
 - output: multilevel hierarchy from graph coarsening
- interaction
 - user changed selected focus point
- visual encoding
 - hybrid view made from cut through several hierarchy levels

[Fig 4.8. Topological Fisheye Views for Visualizing Large Graphs. Gansner, Koren and North, IEEE TVCG 11(4), p 457-468, 2005]

Coarsening requirements

- uniform cluster/metanode size
- match coarse and fine layout geometries
- scalable

[Fig 3. Topological Fisheye Views for Visualizing Large Graphs. Gansner, Koren and North, IEEE TVCG 11(4), p 457-468, 2005]

Coarsening strategy

- must preserve graph-theoretic properties
- use both topology and geometry
 - topological distance (hops away)
 - geometric distance - but not just proximity alone!
 - just contracting nodes/edges could create new cycles
- derived data: proximity graph

what **not** to do!

[Fig 10, 12. Topological Fisheye Views for Visualizing Large Graphs. Gansner, Koren and North, IEEE TVCG 11(4), p 457-468, 2005]

Candidate pairs: neighbors in original and proximity graph

- proximity graph: compromise between larger DT and smaller RNG
 - better than original graph neighbors alone
 - slow for cases like star graph
- maximize weighted sum of
 - geometric proximity
 - goal: preserve geometry
 - cluster size
 - goal: keep uniform cluster size
 - normalized connection strength
 - goal: preserve topology
 - neighborhood similarity
 - goal: preserve topology
 - degree
 - goal: penalize high-degree nodes to avoid salient artifacts and computational problems

Hybrid graph creation

- cut through coarsening hierarchy to get active nodes
 - animated transitions between states

Final distortion

- geometric distortion for uniform density
- (colorcoded by hierarchy depth just to illustrate algorithm)
 - compare to original
 - compare to simple topologically unaware fisheye distortion

[Fig 2. 15. Topological Fisheye Views for Visualizing Large Graphs. Gansner, Koren and North, IEEE TVCG 11(4), p 457-468, 2005]
