

**University of British Columbia**  
**CPSC 414 Computer Graphics**

**Curves**

Week 13, Mon 24 Nov 2003

**News**

- final
  - LSK 200, noon Tue Dec 9
  - must have photo ID (student ID best)
- hw1, proj2 grades out
- TA lab hours as usual this week
- reminder: my office hours in lab today
  - 10:30-11:30

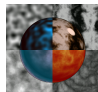

**Schedule: Lab Hours for P3**

- Mon Dec 1
  - AG 10-12, AW 12-2
- Tue Dec 2
  - AG 10-12, AW 12-2, TM 2-4
- Wed Dec 3
  - AW 1-2, PZ 2-4
- Thu Dec 4
  - AG 11-1
- Fri Dec 5
  - AG 10-11, PZ 11-1

**Schedule: Lectures**

- Mon (today)
  - curves
- Wed
  - advanced rendering, final review
- Fri
  - evaluations, 3D CG in movies
    - Pixar shorts, The Shape of Space

**Procedural Approaches recap**

- fractal landscapes 
- L-systems 
- particle systems 
- Perlin noise 

**University of British Columbia**  
**CPSC 414 Computer Graphics**

**Curves recap**

## Splines

- *spline* is parametric curve defined by *control points*
  - *knots*: control points that lie on curve
  - engineering drawing: spline was flexible wood, control points were physical weights

A Duck (weight)

Ducks trace out curve

Week 13, Mon 24 Nov 03

7

## Hermite Spline

- user provides
  - endpoints
  - derivatives at endpoints

$$x = \begin{bmatrix} x_1 & x_0 & x'_1 & x'_0 \end{bmatrix} \begin{bmatrix} -2 & 3 & 0 & 0 \\ 2 & -3 & 0 & 1 \\ 1 & -1 & 0 & 0 \\ 1 & -2 & 1 & 0 \end{bmatrix} \begin{bmatrix} t^3 \\ t^2 \\ t \\ 1 \end{bmatrix}$$

Week 13, Mon 24 Nov 03

© Tamara Munzner

8

## Basis Functions

- a point on a Hermite curve is obtained by multiplying each control point by some function and summing
- functions are called *basis functions*

Week 13, Mon 24 Nov 03

11

## Splines in 2D and 3D

- so far, defined only 1D splines:  
 $x = f(t; x_0, x_1, x'_0, x'_1)$
- for higher dimensions, define control points in higher dimensions (that is, as vectors)

$$\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} x_1 & x_0 & x'_1 & x'_0 \\ y_1 & y_0 & y'_1 & y'_0 \\ z_1 & z_0 & z'_1 & z'_0 \end{bmatrix} \begin{bmatrix} -2 & 3 & 0 & 0 \\ 2 & -3 & 0 & 1 \\ 1 & -1 & 0 & 0 \\ 1 & -2 & 1 & 0 \end{bmatrix} \begin{bmatrix} t^3 \\ t^2 \\ t \\ 1 \end{bmatrix}$$

Week 13, Mon 24 Nov 03

12

## Bézier Curves

- similar to Hermite, but more intuitive definition of endpoint derivatives
- four control points, two of which are knots

Week 13, Mon 24 Nov 03

© Tamara Munzner

13

## Bézier Curves

- derivative values of Bezier curve at knots dependent on adjacent points

$$\nabla p_1 = 3(p_2 - p_1)$$

$$\nabla p_4 = 3(p_4 - p_3)$$

Week 13, Mon 24 Nov 03

© Tamara Munzner

14

## Bézier vs. Hermite

- can write Bezier in terms of Hermite  
– note: just matrix form of previous equations

$$\underbrace{\begin{bmatrix} x_1 & y_1 \\ x_2 & y_2 \\ \frac{dx_1}{dt} & \frac{dy_1}{dt} \\ \frac{dx_2}{dt} & \frac{dy_2}{dt} \end{bmatrix}}_{G_{Hermite}} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 \\ -3 & 3 & 0 & 0 \\ 0 & 0 & -3 & 3 \end{bmatrix} \underbrace{\begin{bmatrix} x_1 & y_1 \\ x_2 & y_2 \\ x_3 & y_3 \\ x_4 & y_4 \end{bmatrix}}_{G_{Bezier}}$$

Week 13, Mon 24 Nov 03

© Tamara Munzner

15

## Bézier vs. Hermite

- Now substitute this in for previous Hermite

$$\begin{bmatrix} a_x & a_y \\ b_x & b_y \\ c_x & c_y \\ d_x & d_y \end{bmatrix} = \underbrace{\begin{bmatrix} 2 & -2 & 1 & 1 \\ -3 & 3 & -2 & -1 \\ 0 & 0 & 1 & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix}}_{M_{Hermite}} \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 \\ -3 & 3 & 0 & 0 \\ 0 & 0 & -3 & 3 \end{bmatrix} \underbrace{\begin{bmatrix} x_1 & y_1 \\ x_2 & y_2 \\ x_3 & y_3 \\ x_4 & y_4 \end{bmatrix}}_{G_{Bezier}}$$

Week 13, Mon 24 Nov 03

© Tamara Munzner

16

## Bézier Basis, Geometry Matrices

$$\begin{bmatrix} a_x & a_y \\ b_x & b_y \\ c_x & c_y \\ d_x & d_y \end{bmatrix} = \underbrace{\begin{bmatrix} -1 & 3 & -3 & 1 \\ 3 & -6 & 3 & 0 \\ -3 & 3 & 0 & 0 \\ 1 & 0 & 0 & 0 \end{bmatrix}}_{M_{Bezier}} \underbrace{\begin{bmatrix} x_1 & y_1 \\ x_2 & y_2 \\ x_3 & y_3 \\ x_4 & y_4 \end{bmatrix}}_{G_{Bezier}}$$

- but why is  $M_{Bezier}$  a good basis matrix?

Week 13, Mon 24 Nov 03

© Tamara Munzner

17

## Bézier Blending Functions

- look at blending functions

- family of polynomials called order-3 Bernstein polynomials
  - $C(3, k) t^k (1-t)^{3-k}$ ;  $0 \leq k \leq 3$
  - all positive in interval  $[0, 1]$
  - sum is equal to 1

$$p(t) = \begin{bmatrix} (1-t)^3 \\ 3t(1-t)^2 \\ 3t^2(1-t) \\ t^3 \end{bmatrix}^T \begin{bmatrix} p_1 \\ p_2 \\ p_3 \\ p_4 \end{bmatrix}$$

Week 13, Mon 24 Nov 03

© Tamara Munzner

18

## Bézier Blending Functions

- every point on curve is linear combination of control points
- weights of combination are all positive
- sum of weights is 1
- therefore, curve is a convex combination of the control points

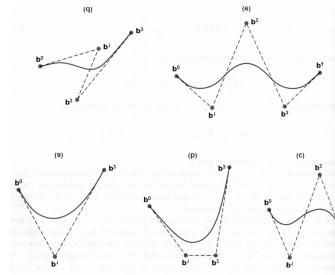

Week 13, Mon 24 Nov 03

© Tamara Munzner

19

## Bézier Curves

- curve will always remain within convex hull (bounding region) defined by control points

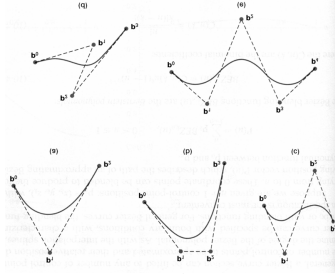

Week 13, Mon 24 Nov 03

© Tamara Munzner

20

## Bézier Curves

- interpolate between first, last control points
- 1<sup>st</sup> point's tangent along line joining 1<sup>st</sup>, 2<sup>nd</sup> pts
- 4<sup>th</sup> point's tangent along line joining 3<sup>rd</sup>, 4<sup>th</sup> pts

## Comparing Hermite and Bezier

demo: [www.siggraph.org/education/materials/HyperGraph/modeling/splines/demoprogram/curve.html](http://www.siggraph.org/education/materials/HyperGraph/modeling/splines/demoprogram/curve.html)

Week 13, Mon 24 Nov 03

© Tamara Munzner

23

## Rendering Bézier Curves: Simple

- evaluate curve at fixed set of parameter values, join points with straight lines
- advantage: very simple
- disadvantages:
  - expensive to evaluate the curve at many points
  - no easy way of knowing how fine to sample points, and maybe sampling rate must be different along curve
  - no easy way to adapt: hard to measure deviation of line segment from exact curve

Week 13, Mon 24 Nov 03

© Tamara Munzner

24

## Rendering Beziers: Subdivision

- a cubic Bezier curve can be broken into two shorter cubic Bezier curves that exactly cover original curve
- suggests a rendering algorithm:
  - keep breaking curve into sub-curves
  - stop when control points of each sub-curve are nearly collinear
  - draw the control polygon: polygon formed by control points

Week 13, Mon 24 Nov 03

© Tamara Munzner

25

## Sub-Dividing Bezier Curves

- step 1: find the midpoints of the lines joining the original control vertices. call them  $M_{01}$ ,  $M_{12}$ ,  $M_{23}$

Week 13, Mon 24 Nov 03

© Tamara Munzner

26

## Sub-Dividing Bezier Curves

- step 2: find the midpoints of the lines joining  $M_{01}$ ,  $M_{12}$  and  $M_{12}$ ,  $M_{23}$ . call them  $M_{012}$ ,  $M_{123}$

Week 13, Mon 24 Nov 03

© Tamara Munzner

27

## Sub-Dividing Bezier Curves

- step 3: find the midpoint of the line joining  $M_{012}$ ,  $M_{123}$ . call it  $M_{0123}$

Week 13, Mon 24 Nov 03

© Tamara Munzner

28

## Sub-Dividing Bezier Curves

- curve  $P_0, M_{01}, M_{012}, M_{0123}$  exactly follows original from  $t=0$  to  $t=0.5$
- curve  $M_{0123}, M_{123}, M_{23}, P_3$  exactly follows original from  $t=0.5$  to  $t=1$

Week 13, Mon 24 Nov 03

© Tamara Munzner

29

## Sub-Dividing Bezier Curves

- continue process to create smooth curve

Week 13, Mon 24 Nov 03

© Tamara Munzner

30

## de Casteljau's Algorithm

- can find the point on a Bezier curve for any parameter value  $t$  with similar algorithm
  - for  $t=0.25$ , instead of taking midpoints take points 0.25 of the way

demo: [www.saltire.com/applets/advanced\\_geometry/spline/spline.htm](http://www.saltire.com/applets/advanced_geometry/spline/spline.htm)  
 Week 13, Mon 24 Nov 03 © Tamara Munzner 31

## Longer Curves

- a single cubic Bezier or Hermite curve can only capture a small class of curves
  - at most 2 inflection points
- one solution is to raise the degree
  - allows more control, at the expense of more control points and higher degree polynomials
  - control is not *local*, one control point influences entire curve
- better solution is to join pieces of cubic curve together into *piecewise cubic curves*
  - total curve can be broken into pieces, each of which is cubic
  - *local control*: each control point only influences a limited part of the curve
  - interaction and design is much easier

Week 13, Mon 24 Nov 03 © Tamara Munzner 32

## Piecewise Bezier: Continuity Problems

demo: [www.cs.princeton.edu/~min/cs426/jar/bezier.html](http://www.cs.princeton.edu/~min/cs426/jar/bezier.html)

Week 13, Mon 24 Nov 03 © Tamara Munzner 33

## Continuity

- when two curves joined, typically want some degree of continuity across knot boundary
  - $C^0$ , “C-zero”, point-wise continuous, curves share same point where they join
  - $C^1$ , “C-one”, continuous derivatives
  - $C^2$ , “C-two”, continuous second derivatives

Week 13, Mon 24 Nov 03 © Tamara Munzner 34

## Geometric Continuity

- derivative continuity is important for animation
  - if object moves along curve with constant parametric speed, should be no sudden jump at knots
- for other applications, *tangent continuity* suffices
  - requires that the tangents point in the same direction
  - referred to as  $G^1$  *geometric continuity*
  - curves could be made  $C^1$  with a re-parameterization
  - geometric version of  $C^2$  is  $G^2$ , based on curves having the same radius of curvature across the knot

Week 13, Mon 24 Nov 03 © Tamara Munzner 35

## Achieving Continuity

- Hermite curves
  - user specifies derivatives, so  $C^1$  by sharing points and derivatives across knot
- Bezier curves
  - they interpolate endpoints, so  $C^0$  by sharing control pts
  - introduce additional constraints to get  $C^1$ 
    - parametric derivative is a constant multiple of vector joining first/last 2 control points
    - so  $C^1$  achieved by setting  $P_{0,3}=P_{1,0}=J$ , and making  $P_{0,2}$  and  $J$  and  $P_{1,1}$  collinear, with  $J-P_{0,2}=P_{1,1}-J$

Week 13, Mon 24 Nov 03 © Tamara Munzner 36

## B-Spline Curve

- start with a sequence of control points
- select four from middle of sequence  
 $(P_{i-2}, P_{i-1}, P_i, P_{i+1})$ 
  - Bezier and Hermite goes between  $p_{i-2}$  and  $p_{i+1}$
  - B-Spline doesn't interpolate (touch) any of them but approximates the going through  $p_{i-1}$  and  $p_i$

Week 13, Mon 24 Nov 03

© Tamara Munzner

37

## B-Spline

- by far the most popular spline used
- $C_0$ ,  $C_1$ , and  $C_2$  continuous

demo: [www.siggraph.org/education/materials/HyperGraph/modeling/splines/demoprogram/curve.html](http://www.siggraph.org/education/materials/HyperGraph/modeling/splines/demoprogram/curve.html)

Week 13, Mon 24 Nov 03

© Tamara Munzner

38

## B-Spline

- locality of points

Figure 10-41

Local modification of a B-spline curve. Changing one of the control points in (a) produces curve (b), which is modified only in the neighborhood of the altered control point.
