

**University of British Columbia**  
**CPSC 414 Computer Graphics**  
**Scan Conversion**  
 Week 6, Mon 6 Oct 2003

- recap: Bresenham line algorithm
- scan conversion: polygons

© Tamara Munzner

1

## News

- Homework 1 out
  - due Wed 15 Oct at beginning of class
  - all late work must be in by Fri 17 Oct
    - solutions out then to help with midterm studying

Week 6, Fri 6 Oct 03

© Tamara Munzner

2

## Scan Conversion recap

- given vertices in DCS, fill in the pixels
  - start with lines

Week 6, Fri 6 Oct 03

© Tamara Munzner

3

## Lines: DDA -> Bresenham recap

- operate only on integers and avoid rounding
- decision variable: after drawing point  $(x,y)$  decide whether to draw
  - $(x+1,y)$ : case E (“east”)
  - $(x+1,y+1)$ : case NE (“north-east”)
- create discriminator,  $d = d_1 - d_2$ 
  - If  $d > 0$   $y$  increases
  - If  $d \leq 0$   $y$  stays the same

– <http://www.cs.technion.ac.il/~cs234325/Homepage/Applets/applets/bresenham/GermanApplet.html>

Week 6, Fri 6 Oct 03

© Tamara Munzner

4

## Scan Conversion of Lines

- discussion
  - Bresenham sets same pixels as DDA
  - intensity of line varies with its angle!

Week 6, Fri 6 Oct 03

© Tamara Munzner

5

## Scan Conversion of Lines

- discussion
  - Bresenham
    - good for hardware implementations (integer!)
  - DDA
    - may be faster for software (depends on system)!
    - floating point ops higher parallelized (pipelined)
      - e.g. RISC CPUs from MIPS, SUN
    - no if statements in inner loop
      - more efficient use of processor pipelining

Week 6, Fri 6 Oct 03

© Tamara Munzner

6

## Rasterizing Polygons

- In interactive graphics, polygons rule the world
- Two main reasons:
  - Lowest common denominator for surfaces
    - Can represent any surface *with arbitrary accuracy*
    - Splines, mathematical functions, volumetric isosurfaces...
  - Mathematical simplicity lends itself to simple, regular rendering algorithms
    - Like those we're about to discuss...
    - Such algorithms embed well in hardware

Week 6, Fri 6 Oct 03

© Tamara Munzner

7

## Rasterizing Polygons

- Triangle is the *minimal unit* of a polygon
  - All polygons can be broken up into triangles
  - Triangles are guaranteed to be:
    - Planar
    - Convex

Week 6, Fri 6 Oct 03

© Tamara Munzner

8

## Triangularization

- Convex polygons easily triangulated
- Concave polygons present a challenge

Week 6, Fri 6 Oct 03

© Tamara Munzner

9

## OpenGL Triangularization

- simple convex polygons
  - break into triangles, trivial
  - `glBegin(GL_POLYGON) ... glEnd()`
- concave or non-simple polygons
  - break into triangles, more effort
  - `gluNewTess(), gluTessCallback(), ...`

Week 6, Fri 6 Oct 03

© Tamara Munzner

10

## Scan Conversion of Polygons

- Simple Algorithm:
  - Draw edges of polygon
  - Use flood-fill to draw interior

Week 6, Fri 6 Oct 03

© Tamara Munzner

11

## Scan Conversion of Polygons

- Flood Fill
  - Start with *seed point*
  - *Recursively set all neighbors until boundary is hit*

Week 6, Fri 6 Oct 03

© Tamara Munzner

12

## Scan Conversion of Polygons

- Discussion – Flood Fill
  - Breadth-first traversal
  - Temporary memory needed for storing boundary
  - Pixels visited up to 4 times to check if already set
  - Problems with other primitives with same color
    - Need per-pixel flag indicating if set already
    - Needs to be cleared for every polygon!

Week 6, Fri 6 Oct 03

© Tamara Munzner

13

## Scan Conversion of Polygons

- Scanline Algorithm
  - Scanline: a line of pixels in an image

Week 6, Fri 6 Oct 03

© Tamara Munzner

14

## Scan Conversion of Polygons

- Classes of Polygons
  - Triangles
    - Simple algorithms based on scan-conversion of edges followed by filling of scanlines
  - General polygons
    - More complicated scanline algorithms

Week 6, Fri 6 Oct 03

© Tamara Munzner

15

## Rasterizing Triangles

- Interactive graphics hardware commonly uses *edge walking* or *edge equation* techniques for rasterizing triangles

Week 6, Fri 6 Oct 03

© Tamara Munzner

16

## Edge Walking

- Basic idea:
  - Draw edges vertically
    - Interpolate colors down edges
  - Fill in horizontal spans for each scanline
    - At each scanline, interpolate edge colors across span

Week 6, Fri 6 Oct 03

© Tamara Munzner

17

## Edge Walking: Notes

- Order three triangle vertices in x and y
  - Find middle point in y dimension and compute if it is to the left or right of polygon. Also could be flat top or flat bottom triangle
- We know where left and right edges are.
  - Proceed from top scanline downwards
  - Fill each span
  - Until breakpoint or bottom vertex is reached
- Advantage: can be made very fast
- Disadvantages:
  - Lots of finicky special cases

Week 6, Fri 6 Oct 03

© Tamara Munzner

18

## Edge Walking: Disadvantages

- Fractional offsets:

- Be careful when interpolating color values!
- Beware of gaps between adjacent edges
- Beware of duplicating shared edges

Week 6, Fri 6 Oct 03

© Tamara Munzner

19

## Edge Equations

- An edge equation is simply the equation of the line defining that edge
  - Q: *What is the implicit equation of a line?*
  - A:  $Ax + By + C = 0$
  - Q: *Given a point  $(x,y)$ , what does plugging  $x$  &  $y$  into this equation tell us?*
  - A: Whether the point is:
    - On the line:  $Ax + By + C = 0$
    - "Above" the line:  $Ax + By + C > 0$
    - "Below" the line:  $Ax + By + C < 0$

Week 6, Fri 6 Oct 03

© Tamara Munzner

20

## Edge Equations

- Edge equations thus define two *half-spaces*:

Week 6, Fri 6 Oct 03

© Tamara Munzner

21

## Edge Equations

- And a triangle can be defined as the intersection of three positive half-spaces:

Week 6, Fri 6 Oct 03

© Tamara Munzner

22

## Edge Equations

- So...simply turn on those pixels for which all edge equations evaluate to  $> 0$ :

Week 6, Fri 6 Oct 03

© Tamara Munzner

23

## Using Edge Equations

- Which pixels: compute min,max bounding

- Edge equations: compute from vertices
- Orientation: ensure area is positive (*why?*)

Week 6, Fri 6 Oct 03

© Tamara Munzner

24

## Computing Edge Equations

- Want to calculate A, B, C for each edge from  $(x_1, y_1)$  and  $(x_2, y_2)$
- Treat it as a linear system:
 
$$Ax_1 + By_1 + C = 0$$

$$Ax_2 + By_2 + C = 0$$
- Notice: two equations, three unknowns
- *What can we solve?*
- Goal: solve for A & B in terms of C

Week 6, Fri 6 Oct 03

© Tamara Munzner

25

## Computing Edge Equations

- Set up the linear system:
 
$$\begin{bmatrix} x_0 & y_0 \\ x_1 & y_1 \end{bmatrix} \begin{bmatrix} A \\ B \end{bmatrix} = -C \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$
- Multiply both sides by matrix inverse:
 
$$\begin{bmatrix} A \\ B \end{bmatrix} = \frac{-C}{x_0 y_1 - x_1 y_0} \begin{bmatrix} y_1 - y_0 \\ x_1 - x_0 \end{bmatrix}$$
- Let  $C = x_0 y_1 - x_1 y_0$  for convenience
  - Then  $A = y_0 - y_1$  and  $B = x_0 - x_1$

Week 6, Fri 6 Oct 03

© Tamara Munzner

26

## Edge Equations

- So...we can find edge equation from two verts.
- Given three corners  $P_0, P_1, P_2$  of a triangle, what are our three edges?
- *How do we make sure the half-spaces defined by the edge equations all share the same sign on the interior of the triangle?*
- A: Be consistent (Ex:  $[P_0 P_1], [P_1 P_2], [P_2 P_0]$ )
- *How do we make sure that sign is positive?*
- A: Test, and flip if needed ( $A = -A, B = -B, C = -C$ )

Week 6, Fri 6 Oct 03

© Tamara Munzner

27

## Edge Equations: Code

- Basic structure of code:
  - Setup: compute edge equations, bounding box
  - (Outer loop) For each scanline in bounding box...
  - (Inner loop) ...check each pixel on scanline, evaluating edge equations and drawing the pixel if all three are positive

Week 6, Fri 6 Oct 03

© Tamara Munzner

28

## Edge Equations: Code

```
findBoundingBox(&xmin, &xmax, &ymin, &ymax);
setupEdges (&a0, &b0, &c0, &a1, &b1, &c1, &a2, &b2, &c2);

/* Optimize this: */
for (int y = ymin; y <= ymax; y++) {
    for (int x = xmin; x <= xmax; x++) {
        float e0 = a0*x + b0*y + c0;
        float e1 = a1*x + b1*y + c1;
        float e2 = a2*x + b2*y + c2;
        if (e0 > 0 && e1 > 0 && e2 > 0)
            setPixel(x, y);
    }
}
```

Week 6, Fri 6 Oct 03

29

## Scanline Algorithm

Week 6, Fri 6 Oct 03

© Tamara Munzner

30

## Triangle Rasterization Issues

- *Exactly which pixels should be lit?*
- A: Those pixels inside the triangle edges
- *What about pixels exactly on the edge?*
  - Draw them: order of triangles matters (it shouldn't)
  - Don't draw them: gaps possible between triangles
- We need a consistent (if arbitrary) rule
  - Example: draw pixels on left or top edge, but not on right or bottom edge

Week 6, Fri 6 Oct 03

© Tamara Munzner

32

## Triangle Rasterization Issues

- Sliver

Week 6, Fri 6 Oct 03

© Tamara Munzner

33

## Triangle Rasterization Issues

- Moving Slivers

Week 6, Fri 6 Oct 03

© Tamara Munzner

34

## Triangle Rasterization Issues

- Shared Edge Ordering

Week 6, Fri 6 Oct 03

© Tamara Munzner

35

## General Polygon Rasterization

- Now that we can rasterize triangles, what about general polygons?
- We'll take an edge-walking approach

Week 6, Fri 6 Oct 03

© Tamara Munzner

36

## General Polygon Rasterization

- Consider the following polygon:

- How do we know whether a given pixel on the scanline is inside or outside the polygon?

Week 6, Fri 6 Oct 03

© Tamara Munzner

37

## Polygon Rasterization

- Inside-Outside Points

Week 6, Fri 6 Oct 03

© Tamara Munzner

38

## Polygon Rasterization

- Inside-Outside Points

Week 6, Fri 6 Oct 03

© Tamara Munzner

39

## General Polygon Rasterization

- Basic idea: use a *parity test*

```

for each scanline
  edgeCnt = 0;
  for each pixel on scanline
    if (oldpixel->newpixel crosses edge)
      edgeCnt ++;
    // draw the pixel if edgeCnt odd
    if (edgeCnt % 2)
      setPixel(pixel);
  
```

Week 6, Fri 6 Oct 03

© Tamara Munzner

40

## General Polygon Rasterization

- Count your vertices carefully
  - If exactly on pixel boundary?
  - Shared vertices?
  - Vertices defining horizontal edge?
    - Consider A-B versus I-H

Week 6, Fri 6 Oct 03

© Tamara Munzner

41

## Polygon Rasterization Edge Cases

For scanline, determine all intersections of polygon edges with scanline  
 Sort edge intersections in least to greatest order  
 Use parity count to determine when pixels are drawn  
 Horizontal lines do not contribute to parity count  
 $Y_{min}$  endpoints do contribute to parity count  
 $Y_{max}$  endpoints do not contribute to parity count

Week 6, Fri 6 Oct 03

© Tamara Munzner

42

## Faster Polygon Rasterization

- How can we optimize the code?

```

for each scanline
  edgeCnt = 0;
  for each pixel on scanline (l to r)
    if (oldpixel->newpixel crosses edge)
      edgeCnt ++;
    // draw the pixel if edgeCnt odd
    if (edgeCnt % 2)
      setPixel(pixel);
  
```

- Big cost: testing pixels against each edge
- Solution: *active edge table (AET)*

Week 6, Fri 6 Oct 03

© Tamara Munzner

43

## Active Edge Table

- Idea:
  - Edges intersecting a given scanline are likely to intersect the next scanline
  - The order of edge intersections doesn't change much from scanline to scanline

Week 6, Fri 6 Oct 03

© Tamara Munzner

44

## Active Edge Table

- Algorithm: scanline from bottom to top...
  - Sort all edges by their minimum y coord
  - Starting at bottom, add edges with  $Y_{\min} = 0$  to AET
  - For each scanline:
    - Sort edges in AET by x intersection
    - Walk from left to right, setting pixels by parity rule
    - Increment scanline
    - Retire edges with  $Y_{\max} < Y$
    - Add edges with  $Y_{\min} < Y$
    - Recalculate edge intersections
  - Stop when  $Y > Y_{\max}$  for last edges

Week 6, Fri 6 Oct 03
