

**University of British Columbia**  
**CPSC 414 Computer Graphics**

**Scan Conversion**

Week 6, Wed 8 Oct 2003

- recap: polygon scan conversion
- interpolation
- barycentric coords
- transforming normals
- sampling

© Tamara Munzner

1

**News**

- Homework 1
  - problem 18
    - **x and y transposed** in bottom layer
  - problem 4
    - rotate 30 deg **around x axis** with fixed point of (3.5,12,1)
  - new correct PDF posted
  - reminder: no late work after Fri 17 Oct 9am
    - handin box 18 CICSIR basement
- Project 1
  - solution, hall of fame on Friday

Week 6, Wed 8 Oct 03

© Tamara Munzner

2

**News**

- Office hours reminder: FSC 2618
  - Mondays 10:30-11:30 or by appointment
  - exceptions: Oct 20, Nov 10
- Readings
  - Chap 8.9-8.11, Fri 10/3 slide notes

Week 6, Wed 8 Oct 03

© Tamara Munzner

3

**Simple Polygon Scanconversion**

- flood fill: simple, slow
  - start with *seed point*
  - recursively set all neighbors until boundary is hit

Week 6, Wed 8 Oct 03

© Tamara Munzner

4

**Scanline Algorithms**

- given vertices, fill in the pixels

**triangles**

- split into two regions
- fill in between edges

**arbitrary polygons (non-simple, non-convex)**

- build edge table
- for each scanline
  - obtain list of intersections, i.e., AEL
  - use parity test to determine in/out and fill in the pixels

Week 6, Wed 8 Oct 03

© Tamara Munzner

5

**Edge Equations**

- define triangle as intersection of three positive half-spaces:

Week 6, Wed 8 Oct 03

© Tamara Munzner

6

## Edge Equations

- So...simply turn on those pixels for which all edge equations evaluate to  $> 0$ :

Week 6, Wed 8 Oct 03

© Tamara Munzner

7

## Edge Equation Consistency

- how to get same +/- state for all equations?
  - consistent counterclockwise vertex traversal
    - good: [0,1], [1,2], [2,0] or [0,2], [2,1], [1,0]
    - bad: [0,1], [2,1], [2,0]

- how to ensure interior is positive?
  - explicit area test: if negative, flip all param signs
    - if (area < 0) { A = -A; B = -B; C = -C; }

Week 6, Wed 8 Oct 03

© Tamara Munzner

8

## Parity for General Case

- use parity for interior test
  - draw pixel if edgecount odd
  - horizontal lines: don't count
  - vertical max: don't count
  - vertical min: count

Week 6, Wed 8 Oct 03

© Tamara Munzner

9

## Edge Tables

- edge table (ET)
  - store edges sorted by y in linked list
    - at ymin, store ymax, xmin, slope
- active edge table (AET)
  - active: currently used for computation
  - store active edges sorted by x
    - update each scanline, store ET values + current\_x
  - for each scanline (from bottom to top)
    - do EAT bookkeeping
    - traverse EAT (from leftmost x to rightmost x)
      - draw pixels if parity odd

Week 6, Wed 8 Oct 03

© Tamara Munzner

10

## Edge Table Bookkeeping

- setup: sorting in y
  - bucket sort, one bucket per pixel
  - add: simple check of  $ET[current\_y]$
  - delete edges if  $edge.y_{max} > current\_y$
- main loop: sorting in x
  - for polygons that do not self-intersect, order of edges does not change between two scanlines
  - so insertion sort while adding new edges suffices

Week 6, Wed 8 Oct 03

© Tamara Munzner

11

University of British Columbia  
CPSC 414 Computer Graphics

## Interpolation

© Tamara Munzner

12

## Scan Conversion

- done:
  - how to determine pixels covered by a primitive
- next:
  - how to assign pixel colors
    - interpolation of colors across triangles
    - interpolation of other properties

Week 6, Wed 8 Oct 03

© Tamara Munzner

13

## Interpolation During Scanconvert

- interpolate values between vertices
  - z values
  - r,g,b colour components
  - u,v texture coordinates
  - $N_x, N_y, N_z$  surface normals
- three equivalent methods (for triangles)
  1. bilinear interpolation
  2. plane equation
  3. barycentric coordinates

Week 6, Wed 8 Oct 03

© Tamara Munzner

14

## 1. Bilinear Interpolation

- interpolate quantity along left-hand and right-hand edges, as a function of y
  - then interpolate quantity as a function of x
- only triangles guarantee orientation-independent interpolation
- compute efficiently by using known values at previous scanline, previous pixel

Week 6, Wed 8 Oct 03

© Tamara Munzner

15

## 2. Plane Equation

- implicit plane equation
  - $z = f(x,y)$
- parametric plane equation
  - $a(x-x_0) + b(y-y_0) + c(z-z_0) = 0$
- explicit plane equation
  - $Plane = A \cdot x + B \cdot y + C \cdot z + D$

Week 6, Wed 8 Oct 03

© Tamara Munzner

16

## 3. Barycentric Coordinates

- weighted combination of vertices

$$\begin{cases} P = \alpha \cdot P_1 + \beta \cdot P_2 + \gamma \cdot P_3 \\ \alpha + \beta + \gamma = 1 \\ 0 \leq \alpha, \beta, \gamma \leq 1 \end{cases}$$

"convex combination of points"

Week 6, Wed 8 Oct 03

© Tamara Munzner

17

## Barycentric Coordinates

- how to compute  $\alpha, \beta, \gamma$  ?
  - use bilinear interpolation or plane equations

interpolate  $\alpha, \beta, \gamma$   
just like we did for z

$$\begin{cases} \alpha = a \cdot x + b \cdot y + c \cdot z + d \\ \beta = \dots \end{cases}$$

- once computed, use to interpolate any # of parameters from their vertex values

$$z = \alpha \cdot z_1 + \beta \cdot z_2 + \gamma \cdot z_3$$

$$r = \alpha \cdot r_1 + \beta \cdot r_2 + \gamma \cdot r_3$$

$$g = \alpha \cdot g_1 + \beta \cdot g_2 + \gamma \cdot g_3$$

etc.

Week 6, Wed 8 Oct 03

© Tamara Munzner

18

## Interpolation: Gouraud Shading

- need linear function over triangle that yields original vertex colors at vertices
- use barycentric coordinates for this
  - every pixel in interior gets colors resulting from mixing colors of vertices with weights corresponding to barycentric coordinates
  - color at pixels is affine combination of colors at vertices

$$\text{Color}(\alpha \cdot \mathbf{x}_1 + \beta \cdot \mathbf{x}_2 + \gamma \cdot \mathbf{x}_3) := \alpha \cdot \text{Color}(\mathbf{x}_1) + \beta \cdot \text{Color}(\mathbf{x}_2) + \gamma \cdot \text{Color}(\mathbf{x}_3)$$

Week 6, Wed 8 Oct 03

© Tamara Munzner

19

## Interpolation: Gouraud Shading

- we know
  - affine combinations are invariant under affine transformations
- thus
  - does not matter whether colors are interpolated *before* or after *affine* transformations!
  - colors do not shift around on the surface with affine transformations, but stay attached to every surface point

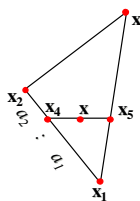

Week 6, Wed 8 Oct 03

© Tamara Munzner

20

## Computing Barycentric Coords

- how do we find barycentric coordinates for every pixel efficiently?
  - look at a point  $\mathbf{x}$  on a scanline:

$$\begin{aligned} \mathbf{x}_4 &= \mathbf{x}_1 + \frac{a_1}{a_1 + a_2} (\mathbf{x}_2 - \mathbf{x}_1) \\ &= \left(1 - \frac{a_1}{a_1 + a_2}\right) \cdot \mathbf{x}_1 + \frac{a_1}{a_1 + a_2} \cdot \mathbf{x}_2 \\ &= \frac{a_2}{a_1 + a_2} \cdot \mathbf{x}_1 + \frac{a_1}{a_1 + a_2} \cdot \mathbf{x}_2 \end{aligned}$$

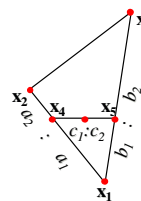

Week 6, Wed 8 Oct 03

© Tamara Munzner

21

## Computing Barycentric Coords

- similarly:

$$\begin{aligned} \mathbf{x}_5 &= \frac{b_2}{b_1 + b_2} \cdot \mathbf{x}_1 + \frac{b_1}{b_1 + b_2} \cdot \mathbf{x}_3 \\ \mathbf{x} &= \frac{c_2}{c_1 + c_2} \cdot \mathbf{x}_4 + \frac{c_1}{c_1 + c_2} \cdot \mathbf{x}_5 \end{aligned}$$

Week 6, Wed 8 Oct 03

© Tamara Munzner

22

## Computing Barycentric Coords

combining

$$\begin{aligned} \mathbf{x} &= \frac{c_2}{c_1 + c_2} \cdot \mathbf{x}_4 + \frac{c_1}{c_1 + c_2} \cdot \mathbf{x}_5 & \mathbf{x}_4 &= \frac{a_2}{a_1 + a_2} \cdot \mathbf{x}_1 + \frac{a_1}{a_1 + a_2} \cdot \mathbf{x}_2 \\ & & \mathbf{x}_5 &= \frac{b_2}{b_1 + b_2} \cdot \mathbf{x}_1 + \frac{b_1}{b_1 + b_2} \cdot \mathbf{x}_3 \end{aligned}$$

gives

$$\mathbf{x} = \frac{c_2}{c_1 + c_2} \cdot \left( \frac{a_2}{a_1 + a_2} \cdot \mathbf{x}_1 + \frac{a_1}{a_1 + a_2} \cdot \mathbf{x}_2 \right) + \frac{c_1}{c_1 + c_2} \cdot \left( \frac{b_2}{b_1 + b_2} \cdot \mathbf{x}_1 + \frac{b_1}{b_1 + b_2} \cdot \mathbf{x}_3 \right)$$

Week 6, Wed 8 Oct 03

© Tamara Munzner

23

## Computing Barycentric Coords

thus

$$\begin{aligned} \mathbf{x} &= \alpha \cdot \mathbf{x}_1 + \beta \cdot \mathbf{x}_2 + \gamma \cdot \mathbf{x}_3 \\ \text{with } \alpha &= \frac{c_2}{c_1 + c_2} \cdot \frac{a_2}{a_1 + a_2} + \frac{c_1}{c_1 + c_2} \cdot \frac{b_2}{b_1 + b_2}, \\ \beta &= \frac{c_2}{c_1 + c_2} \cdot \frac{a_1}{a_1 + a_2} \\ \gamma &= \frac{c_1}{c_1 + c_2} \cdot \frac{b_1}{b_1 + b_2} \end{aligned}$$

Week 6, Wed 8 Oct 03

© Tamara Munzner

24

## Computing Barycentric Coords

- can prove correct by verifying barycentric properties
  - $\alpha + \beta + \gamma = 1$
  - $0 \leq \alpha, \beta, \gamma \leq 1$

## Gouraud Shading with Bary Coords

- algorithm
  - modify scanline algorithm for polygon scan-conversion as follows:
    - linearly interpolate colors along edges of triangle to obtain colors for endpoints of span of pixels
    - linearly interpolate colors from these endpoints within the scanline

University of British Columbia  
CPSC 414 Computer Graphics

## Transforming Normals

## Interpolation During Scanconvert

- interpolate values between vertices
  - z values
  - r,g,b colour components
  - u,v texture coordinates
  - $N_x, N_y, N_z$  surface normals

## Computing Normals

- polygon:

- assume vertices ordered CCW when viewed from visible side of polygon
- normal for a vertex
  - used for lighting
  - supplied by model (i.e., sphere), or computed from neighboring polygons

## Transforming Normals

- what is a normal?

- a **direction**
- earlier: vector as direction

$$\begin{bmatrix} x \\ y \\ z \\ 0 \end{bmatrix}$$

- so if points transformed by modelview vector M, can we just transform vector by M too?

$$\begin{bmatrix} Nx' \\ Ny' \\ Nz' \\ 0 \end{bmatrix} = \begin{bmatrix} m_{11} & m_{12} & m_{13} & T_x \\ m_{21} & m_{22} & m_{23} & T_y \\ m_{31} & m_{32} & m_{33} & T_z \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} Nx \\ Ny \\ Nz \\ 0 \end{bmatrix}$$

## Transforming Normals

$$\begin{bmatrix} x' \\ y' \\ z' \\ 0 \end{bmatrix} = \begin{bmatrix} m_{11} & m_{12} & m_{13} & T_x \\ m_{21} & m_{22} & m_{23} & T_y \\ m_{31} & m_{32} & m_{33} & T_z \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 0 \end{bmatrix}$$

- translations OK:  $w=0$  means unaffected
- rotations OK
- uniform scaling OK
- these all maintain direction

Week 6, Wed 8 Oct 03

© Tamara Munzner

31

## Transforming Normals

- nonuniform scaling does not work
- $x-y=0$  plane
  - line  $x=y$
  - normal:  $[1,-1,0]$ 
    - ignore normalization for now

Week 6, Wed 8 Oct 03

© Tamara Munzner

32

## Transforming Normals

- apply nonuniform scale: stretch along  $x$  by 2
  - new plane  $x = 2y$
- transformed normal

$$\begin{bmatrix} 2 \\ -1 \\ 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 2 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} 1 \\ -1 \\ 0 \\ 0 \end{bmatrix}$$

- $x = -2y$  or  $x+2y=0$
- not perpendicular!
- should be  $2x = -y$

Week 6, Wed 8 Oct 03

© Tamara Munzner

33

## Planes and Normals

- plane is all points such that  $\mathbf{N} \cdot \mathbf{P} = 0$
- or  $\mathbf{N}^T \mathbf{P} = 0$  (must transpose for matrix mult!)

$$\mathbf{N} = \begin{bmatrix} A \\ B \\ C \\ D \end{bmatrix} \quad \mathbf{P} = \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

- explicit form

$$\text{Plane} = A \cdot x + B \cdot y + C \cdot z + D$$

Week 6, Wed 8 Oct 03

© Tamara Munzner

34

## Finding Correct Normal Transform

- transform a plane

$$\begin{matrix} P \\ N \end{matrix} \longrightarrow \begin{matrix} P' = MP \\ N' = QN \end{matrix} \quad \begin{matrix} \text{if we know M,} \\ \text{what should Q be?} \end{matrix}$$

$$N'^T P' = 0 \quad \text{stay perpendicular}$$

$$(QN)^T (MP) = 0 \quad \text{substitute from above}$$

$$N^T Q^T M P = 0 \quad (\mathbf{AB})^T = \mathbf{B}^T \mathbf{A}^T$$

$$Q^T M = I \quad N^T P = 0$$

$$Q = (M^{-1})^T$$

thus the normal to any surface has to be transformed by the inverse transpose of the modelling transformation

Week 6, Wed 8 Oct 03

© Tamara Munzner

35

University of British Columbia  
CPSC 414 Computer Graphics

## Sampling and Antialiasing

© Tamara Munzner

36

## Jaggy Lines

- rasterized lines were not smooth
  - “stair-stepping”, “jaggies”

Week 6, Wed 8 Oct 03

© Tamara Munzner

37

## Smoother Lines

- solution
  - set 2 points with intensity proportional to distance from line

Week 6, Wed 8 Oct 03

© Tamara Munzner

38

## Smoothing Bresenham

- can modify Bresenham alg to do this
  - for every column of pixels, set the two pixels between which the line intersects the column
  - means that decision variable has to be shifted down one pixel  $d = F(x+1, y+1)$
  - increments for E and NE can be determined as before (but results slightly different)
  - $d$  can directly be used to multiply pixel intensities
    - fully integer implementation possible

Week 6, Wed 8 Oct 03

© Tamara Munzner

39

## General Problem

- “jaggies”: undesirable artifact
  - name for general problem is “aliasing”
- solving the general problem
  - “antialiasing”
- theoretical framework
  - sampling, signal processing

Week 6, Wed 8 Oct 03

© Tamara Munzner

40

## Samples

- most things in the real world are **continuous**
- everything in a computer is **discrete**
- the process of mapping a continuous function to a discrete one is called **sampling**
- the process of mapping a discrete function to a continuous one is called **reconstruction**
- the process of mapping a continuous variable to a discrete one is called **quantization**
- rendering an image requires sampling and quantization
- displaying an image involves reconstruction

Week 6, Wed 8 Oct 03

© Tamara Munzner

41

## What is a pixel?

- a pixel is not...
  - a box
  - a disk
  - a teeny tiny little light
- a pixel is a point
  - it has no dimension
  - it occupies no area
  - it cannot be seen
  - it can have a coordinate

a pixel is *more* than a point, it is a **sample**

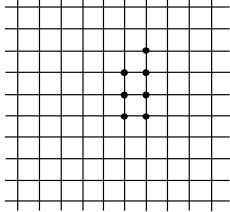

Week 6, Wed 8 Oct 03

© Tamara Munzner

42

## Pixels

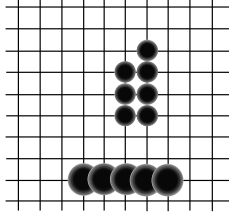

- point samples
  - pixels have no extent!

Week 6, Wed 8 Oct 03 © Tamara Munzner 43

## Pixel Display

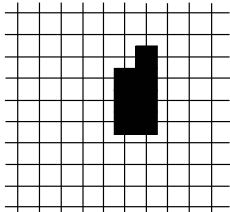

- reconstruction yields continuous function
  - displays constructed to create reconstruction
  - footprints can overlap! (e.g. Gaussians)

Week 6, Wed 8 Oct 03 © Tamara Munzner 44

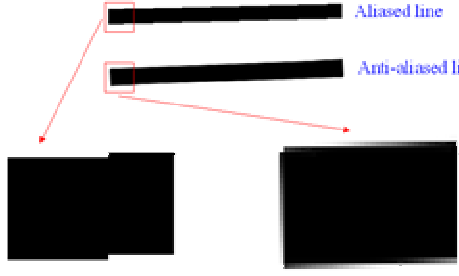

## Pixels

- square pixel model
  - Just ONE possible reconstruction function
  - and a really bad one – leads to poor quality

Week 6, Wed 8 Oct 03 © Tamara Munzner 45

## Anti-Aliasing: Example

Week 6, Wed 8 Oct 03 © Tamara Munzner 46

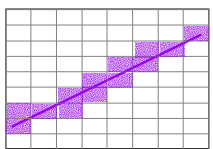

## Samples

Week 6, Wed 8 Oct 03 © Tamara Munzner 47

## Line Segments

- we tried to sample a line segment so it would map to a 2D raster display
- we quantized the pixel values to 0 or 1
- we saw stair steps, or jaggies

Week 6, Wed 8 Oct 03 © Tamara Munzner 48

## Line Segments

- instead, quantize to many shades
- but what sampling algorithm is used?

Week 6, Wed 8 Oct 03

© Tamara Munzner

49

## Area Sampling

- shade pixels according to the area covered by thickened line
- this is unweighted area sampling

- a rough approximation formulated by dividing each pixel into a finer grid of pixels

Week 6, Wed 8 Oct 03

© Tamara Munzner

50

## Unweighted Area Sampling

- primitive cannot affect intensity of pixel if it does not intersect the pixel
- equal areas cause equal intensity, regardless of distance from pixel center to area

Week 6, Wed 8 Oct 03

© Tamara Munzner

51

## Weighted Area Sampling

- unweighted sampling colors two pixels identically when the primitive cuts the same area through the two pixels
- intuitively, pixel cut through the center should be more heavily weighted than one cut along corner

Week 6, Wed 8 Oct 03

© Tamara Munzner

52

## Weighted Area Sampling

- weighting function,  $W(x,y)$ 
  - specifies the contribution of primitive passing through the point  $(x, y)$  from pixel center

Week 6, Wed 8 Oct 03

© Tamara Munzner

53

## Images

- an image is a 2D function  $I(x, y)$  that specifies intensity for each point  $(x, y)$

Week 6, Wed 8 Oct 03

© Tamara Munzner

54

## Sampling and Image

- our goal is to convert the continuous image to a discrete set of samples
- the graphics system's display hardware will attempt to reconvert the samples into a continuous image: *reconstruction*

Week 6, Wed 8 Oct 03

© Tamara Munzner

55

## Point Sampling an Image

- simplest sampling is on a grid
- sample depends solely on value at grid points

Week 6, Wed 8 Oct 03

© Tamara Munzner

56

## Point Sampling

- multiply sample grid by image intensity to obtain a discrete set of points, or samples.

Week 6, Wed 8 Oct 03

© Tamara Munzner

57

## Sampling Errors

- some objects missed entirely, others poorly sampled

Week 6, Wed 8 Oct 03

© Tamara Munzner

58

## Fixing Sampling Errors

- *supersampling*
  - take more than one sample for each pixel and combine them
  - how many samples is enough?
  - how do we know no features are lost?

Week 6, Wed 8 Oct 03

© Tamara Munzner

59
