

Week 4: Facet

Tamara Munzner
 Department of Computer Science
 University of British Columbia

JRNL 520M, Special Topics in Contemporary Journalism: Visualization for Journalists
Week 4: 6 October 2015

<http://www.cs.ubc.ca/~tmm/courses/journ15>

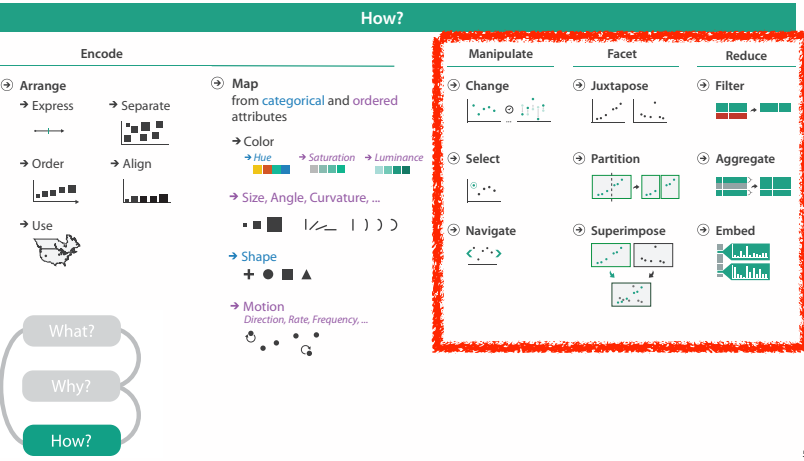

Now

- Finish up color theory + demos (30-45 min)
- break (15 min)
- Recreating News in Tableau (60+ min)
 - working through together in lab mode, not fast in demo mode
- Facet lecture, if there's enough time

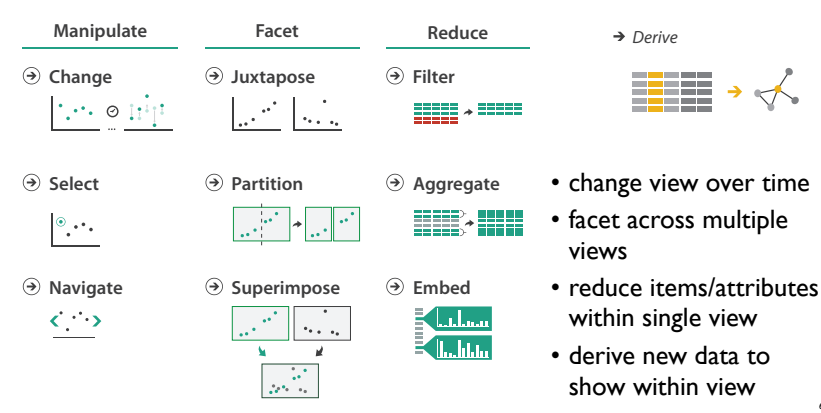

Lab/Assignment 4

- Work through Recreating News Visualizations in Tableau
- Create Drought Footprints yearly and monthly versions
- Fix two previous obstacles from previous labs (but not a duplicate of color for this week)
- submit next week
 - by 9am Tue, email tmm@cs.ubc.ca with subject JOURNWeek 4

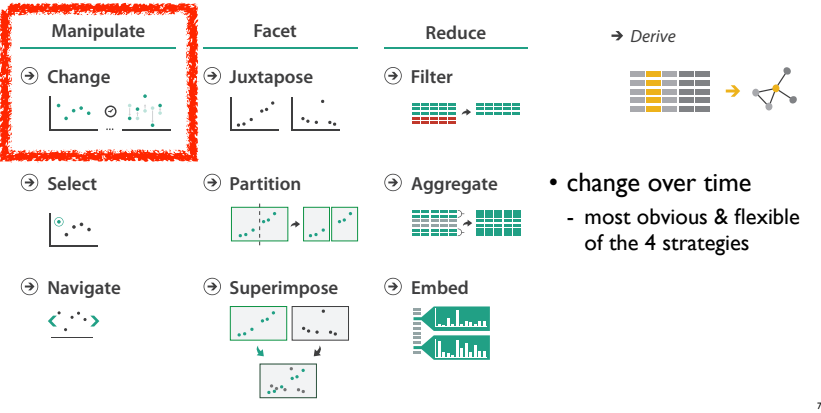

VAD Chap 11: Facet Into Multiple Views

How to handle complexity: 3 more strategies + 1 previous

How to handle complexity: 3 more strategies + 1 previous

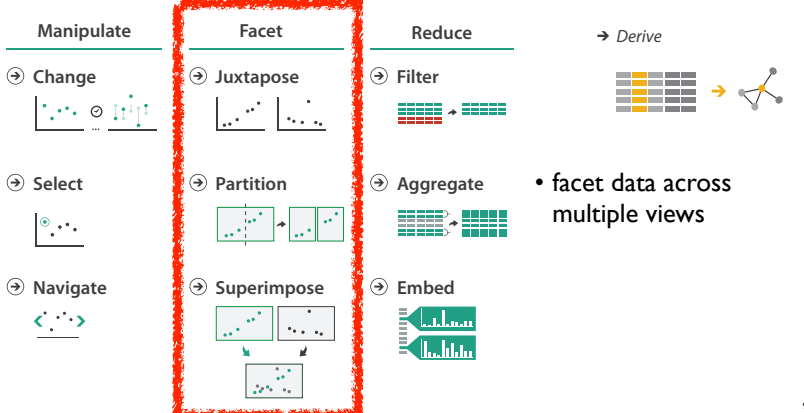

Idiom: Animated transitions

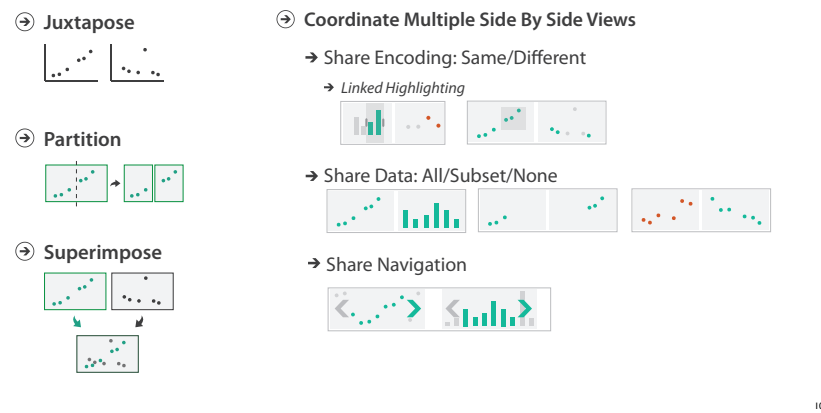

- smooth transition from one state to another
 - alternative to jump cuts
 - support for item tracking when amount of change is limited
- example: multilevel matrix views
 - scope of what is shown narrows down
 - middle block stretches to fill space, additional structure appears within
 - other blocks squish down to increasingly aggregated representations

[Using Multilevel Call Matrices in Large Software Projects. van Ham. Proc. IEEE Symp. Information Visualization (InfoVis), pp. 227–232, 2003.]

How to handle complexity: 3 more strategies + 1 previous

Facet

Idiom: Linked highlighting System: EDV

- see how regions contiguous in one view are distributed within another
 - powerful and pervasive interaction idiom
- encoding: different
 - **multiform**
- data: all shared

[Visual Exploration of Large Structured Datasets. Wills. Proc. New Techniques and Trends in Statistics (NTTS), pp. 237–246. IOS Press, 1995.]

Idiom: bird's-eye maps System: Google Maps

- encoding: same
- data: subset shared
- navigation: shared
 - bidirectional linking
- differences
 - viewpoint
 - (size)
- **overview-detail**

[A Review of Overview+Detail, Zooming, and Focus+Context Interfaces. Cockburn, Karlson, and Bederson. ACM Computing Surveys 41:1 (2008), 1–31.]

Idiom: Small multiples System: Cerebral

- encoding: same
- data: none shared
 - different attributes for node colors
 - (same network layout)
- navigation: shared

[Cerebral: Visualizing Multiple Experimental Conditions on a Graph with Biological Context. Barsky, Munzner, Gardy, and Kincaid. IEEE Trans. Visualization and Computer Graphics (Proc. InfoVis 2008) 14:6 (2008), 1253–1260.]

Coordinate views: Design choice interaction

		Data		
		All	Subset	None
Encoding	Same	Redundant	Overview/Detail	Small Multiples
	Different	Multiform	Multiform, Overview/Detail	No Linkage

- why juxtapose views?
 - benefits: eyes vs memory
 - lower cognitive load to move eyes between 2 views than remembering previous state with single changing view
 - costs: display area, 2 views side by side each have only half the area of one view

Partition into views

- how to divide data between views
 - encodes association between items using spatial proximity
 - major implications for what patterns are visible
 - split according to attributes
- design choices
 - how many splits
 - all the way down: one mark per region?
 - stop earlier, for more complex structure within region?
 - order in which attribs used to split
 - how many views

Partitioning: List alignment

- single bar chart with grouped bars
 - split by state into regions
 - complex glyph within each region showing all ages
 - compare: easy within state, hard across ages
- small-multiple bar charts
 - split by age into regions
 - one chart per region
 - compare: easy within age, harder across states

Partitioning: Recursive subdivision

System: **HIVE**

- split by neighborhood
- then by type
- then time
 - years as rows
 - months as columns
- color by price

[Configuring Hierarchical Layouts to Address Research Questions. Slingsby, Dykes, and Wood. IEEE Transactions on Visualization and Computer Graphics (Proc. InfoVis 2009) 15:6 (2009), 977–984.] 17

Static visual layering

- foreground layer: roads
 - hue, size distinguishing main from minor
 - high luminance contrast from background
- background layer: regions
 - desaturated colors for water, parks, land areas
- user can selectively focus attention
- “get it right in black and white”
 - check luminance contrast with greyscale view

[Get it right in black and white. Stone. 2010. <http://www.stonesc.com/wordpress/2010/03/get-it-right-in-black-and-white>] 21

Partitioning: Recursive subdivision

System: **HIVE**

- switch order of splits
 - type then neighborhood
- switch color
 - by price variation
- type patterns
 - within specific type, which neighborhoods inconsistent

[Configuring Hierarchical Layouts to Address Research Questions. Slingsby, Dykes, and Wood. IEEE Transactions on Visualization and Computer Graphics (Proc. InfoVis 2009) 15:6 (2009), 977–984.] 18

Superimposing limits

- few layers, but many lines
 - up to a few dozen
 - but not hundreds
- superimpose vs juxtapose: empirical study
 - superimposed for local visual, multiple for global
 - same screen space for all multiples, single superimposed
 - tasks
 - local: maximum, global: slope, discrimination

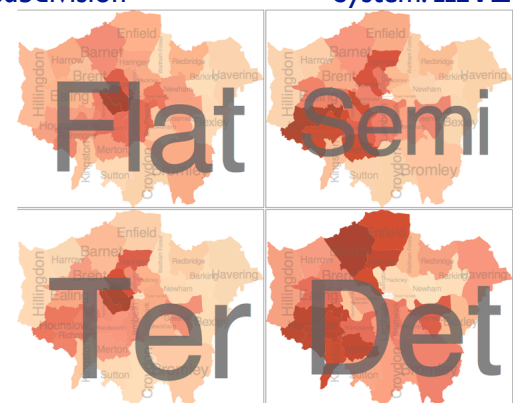

[Graphical Perception of Multiple Time Series. Jovet, McDonnell, and Elmqvist. IEEE Transactions on Visualization and Computer Graphics (Proc. IEEE InfoVis 2010) 16:6 (2010), 927–934.] 22

Partitioning: Recursive subdivision

System: **HIVE**

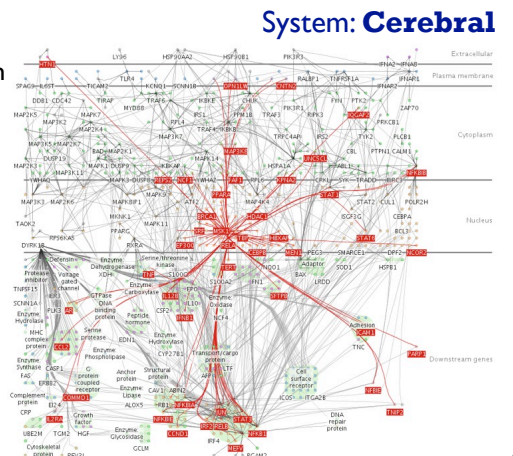

- different encoding for second-level regions
 - choropleth maps

[Configuring Hierarchical Layouts to Address Research Questions. Slingsby, Dykes, and Wood. IEEE Transactions on Visualization and Computer Graphics (Proc. InfoVis 2009) 15:6 (2009), 977–984.] 19

Dynamic visual layering

- interactive, from selection
 - lightweight: click
 - very lightweight: hover
- ex: 1-hop neighbors

[Cerebral: a Cytoscape plugin for layout of and interaction with biological networks using subcellular localization annotation. Barsky, Gady, Hancock, and Munzner. Bioinformatics 23:8 (2007), 1040–1042.] 23

Superimpose layers

- **layer**: set of objects spread out over region
 - each set is visually distinguishable group
 - extent: whole view
- design choices
 - how many layers?
 - how are layers distinguished?
 - small static set or dynamic from many possible?
 - how partitioned?
 - heavyweight with attribs vs lightweight with selection
- distinguishable layers
 - encode with different, nonoverlapping channels
 - two layers achievable, three with careful design
