

Planning: Representation and Forward Search

Computer Science cpsc322, Lecture 17

(Textbook Chpt 8.1 (Skip 8.1.1-2)- 8.2)

Oct, 15, 2012

Lecture Overview

- **Clarification**
- Where are we?
- Planning
 - Example
 - STRIPS: a Feature-Based Representation
 - Forward Planning

Sampling a discrete probability distribution

e.g. Sim. Annealing. Select n' with probability P

$$P = .3$$

generate random number in $[0, 1]$

if $< .3$ accept n' ²

e.g. Beam Search: Select K individuals. Probability of selection proportional to their value

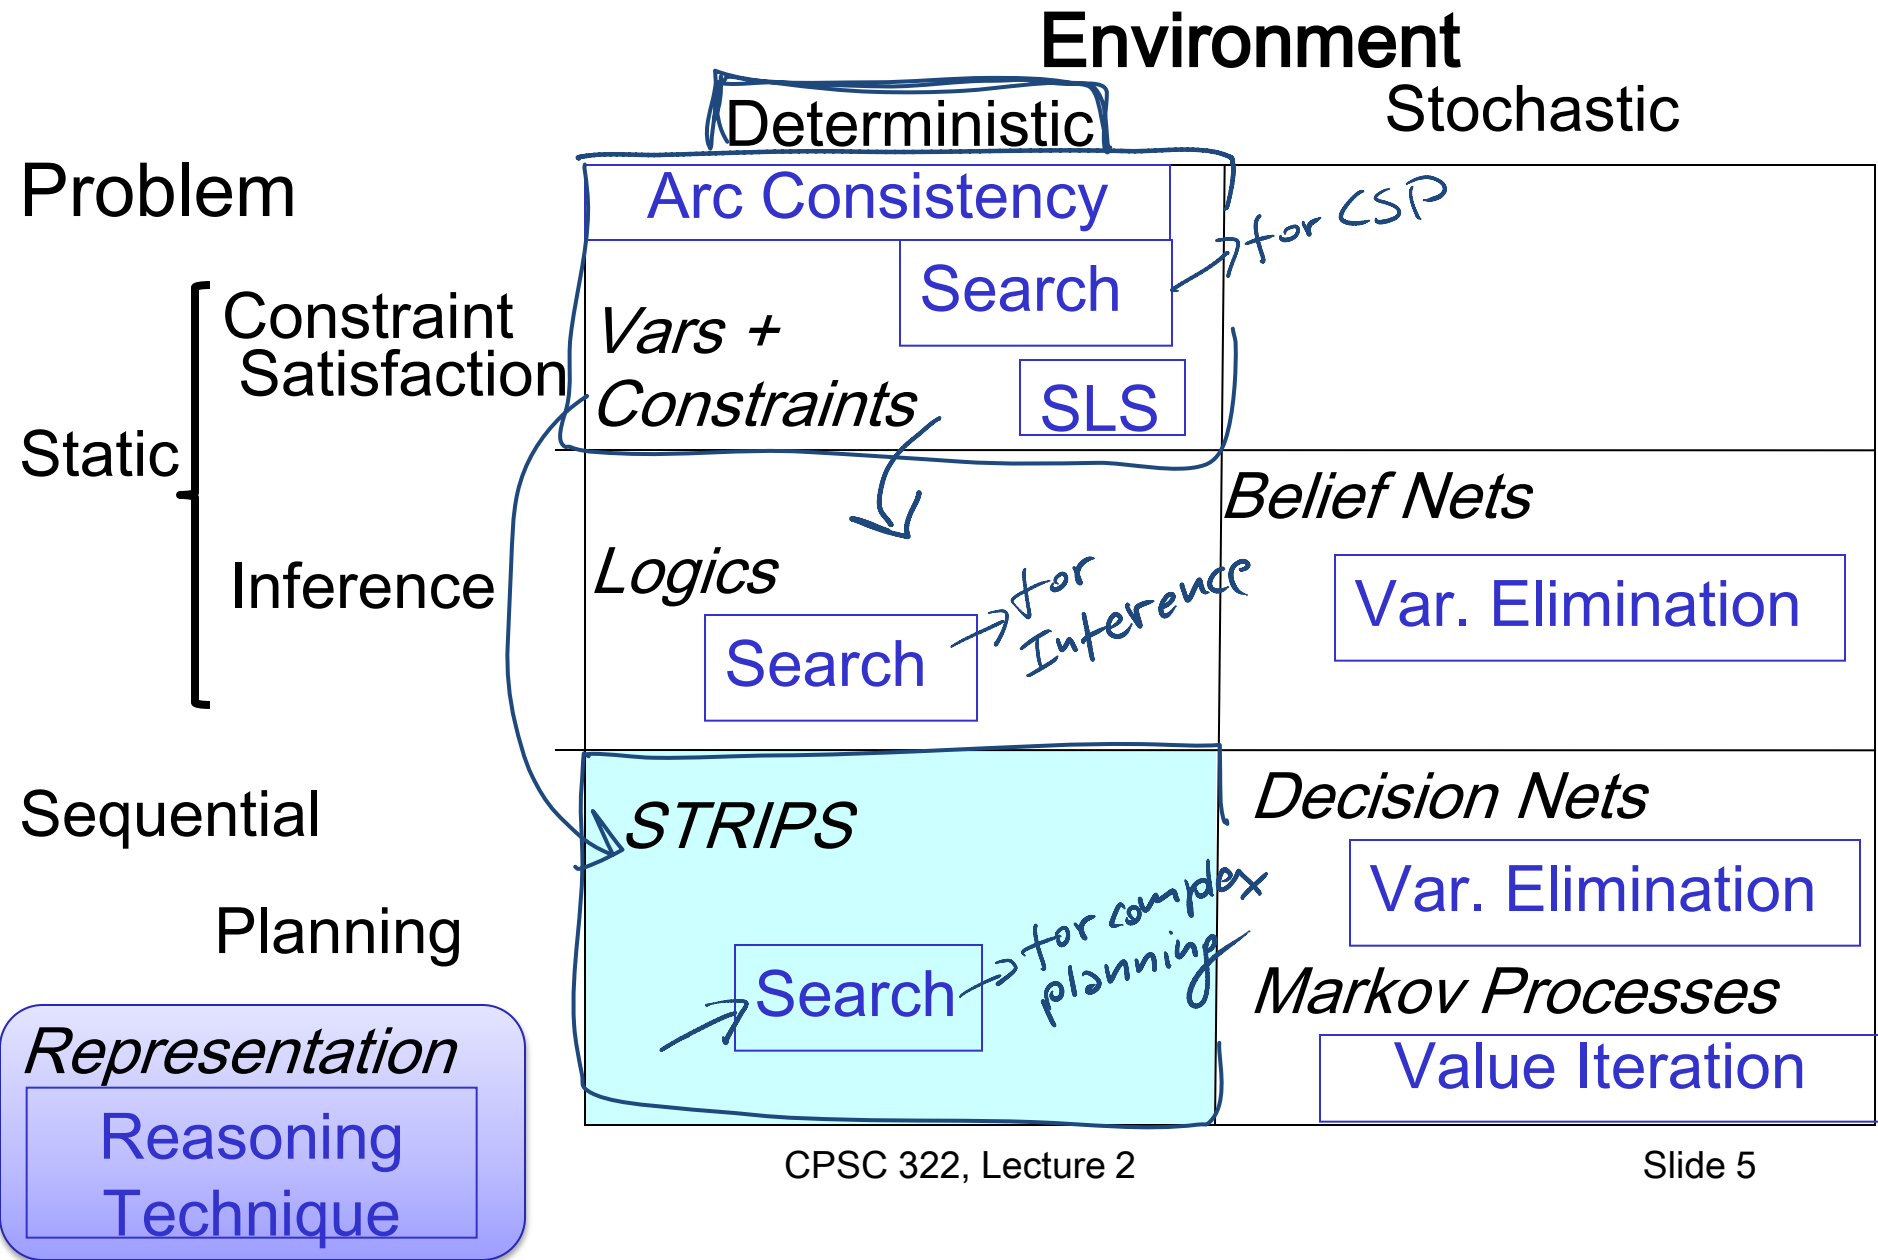

SAME HERE

Lecture Overview

- Clarifications
- **Where are we?**
- Planning
 - Example
 - STRIPS: a Feature-Based Representation
 - Forward Planning

Modules we'll cover in this course: R&Rsys

Standard Search vs. Specific R&R systems

Constraint Satisfaction (Problems):

- **State**: assignments of values to a subset of the variables
- **Successor function**: assign values to a “free” variable
- **Goal test**: set of constraints
- **Solution**: possible world that satisfies the constraints
- **Heuristic function**: *none (all solutions at the same distance from start)*

Planning :

- **State** ↙
- **Successor function** ↙
- **Goal test** ↙
- **Solution** ↙
- **Heuristic function** (*next class*)

Inference

- **State**
- **Successor function**
- **Goal test**
- **Solution**
- **Heuristic function**

- **Planning**
 - Example
 - STRIPS representation and assumption
 - Forward Planning

Planning as Search: State and Goal

How to select and organize a sequence of actions to achieve a given goal...

State: Agent is in a possible world (full assignments to a set of variables/features)

A B C

domain(true, false) (T, F)
(1 0)

[
A = T
B = F
C = T
]

sample state

Goal: Agent wants to be in a possible world where some variables are given specific values

sample goal $[A=T \quad C=F]$

Planning as Search: Successor function and Solution

Actions : take the agent from one state to another

Solution: sequence of actions that when performed will take the agent from the current state to a goal state

IF
start state

sol

$a_1 \quad a_2$

$A = T$
Goal

 - STRIPS representation and assumption
 - Forward Planning

Delivery Robot Example (textbook)

Consider a **delivery robot named Rob**, who must navigate the following environment, can deliver coffee and mail to Sam

Another example will be available as a **Practice Exercise:**
“Commuting to UBC” ←

Delivery Robot Example: States

The state is defined by the following variables/features:

RLoc - Rob's location

- domain: coffee shop (cs), Sam's office (off), mail room (mr), or laboratory (lab)

RHC - Rob has coffee True/False.

SWC - Sam wants coffee T/F

MW - Mail is waiting T/F

RHM - Rob has mail T/F

→ two different notations

Example state: $\{cs, rhc, \overline{swc}, \overline{mw}, rhm\}$

Number of states: 64

32

64

48

16

Delivery Robot Example: Actions

The robot's **actions** are:

Move - Rob's move action

- move clockwise (*mc*), move anti-clockwise (*mac*)
~~not move (mm)~~

PUC - Rob picks up coffee

- • must be at the coffee shop

preconditions

De/C - Rob delivers coffee

- • must be at the office, and must have coffee

PUM - Rob picks up mail

- must be in the mail room, and mail must be waiting

De/M - Rob delivers mail

- must be at the office and have mail

Lecture Overview

- Clarifications
- Where are we?
- Planning
 - Example
 - **STRIPS** representation and assumption (STanford Research Institute Problem Solver) 70's 80's
 - Forward Planning

STRIPS action representation

The key to sophisticated planning is **modeling actions**

In STRIPS, an action has **two parts**:

1. **Preconditions**: a set of assignments to features that **must be satisfied** in order for the action to be legal
2. **Effects**: a set of assignments to features that are **caused** by the action

STRIPS actions: Example_S

STRIPS representation of the action **pick up coffee**, *PUC*:

- preconditions $Loc = cs$ and $RHC = F$
- effects $RHC = T$

STRIPS representation of the action **deliver coffee**, *DelC*:

- preconditions $Loc = off$ and $RHC = T$ ($SWC = T$)
- effects $RHC = F$ and $SWC = F$

Note in this domain Sam doesn't have to want coffee for Rob to deliver it; one way or another, Sam doesn't want coffee after delivery.

STRIPS actions: MC and MAC

STRIPS representation of the action
MoveClockwise ?

$$\frac{mc - CS}{mc - off}$$

Prec loc = CS
Eff loc = office

$$\frac{\vdots}{mac - CS}$$

→ you need
4 specific actions

} → and 4 specific actions
for move anticlockwise

STRIPS Actions (cont')

The STRIPS assumption: all features not explicitly changed by an action stay unchanged

- So if the feature V has value v_i in state S_i , after action a has been performed,
 - what can we conclude about a and/or the state of the world S_{i-1} , immediately preceding the execution of a ?

what can we conclude about a and/or the state of the world S_{i-1} , immediately preceding the execution of a ?

1 $V = v_i$ was TRUE in S_{i-1}

2 One of the effects of a is to set $V = v_i$

3 At least one of the above

4 None of the above

what can we conclude about a and/or the state of the world S_{i-1} , immediately preceding the execution of a ?

3 At least one of the above

Lecture Overview

- Clarifications
- Where are we?
- **Planning**
 - Example
 - STRIPS representation and assumption (STanford Research Institute Problem Solver)
 - **Forward Planning**

Forward Planning

To find a plan, a solution: search in the state-space graph.

- The **states** are the **possible worlds**
- The **arcs** from a state s represent all of the **actions** that are legal in state s .
- A **plan** is a path from the state representing the initial state to a state that satisfies the goal.

What actions a are legal/possible in a state s ?

Those where a 's effects are satisfied in s

Those where the state s' reached via a is on the way to the goal

Those where a 's preconditions are satisfied in s

Forward Planning

To find a plan, a solution: search in the state-space graph.

- The **states** are the **possible worlds**
- The **arcs** from a state ***s*** represent all of the **actions** that are legal in state ***s***.
- A **plan** is a path from the state representing the initial state to a state that satisfies the goal.

What actions ***a*** are legal/possible in a state ***s***?

Those where ***a***'s preconditions are satisfied in ***s***

Example state-space graph: first level

start
state

Actions

mc: move clockwise

mac: move anticlockwise

~~mc: move clockwise~~

puc: pick up coffee

dc: deliver coffee

pum: pick up mail

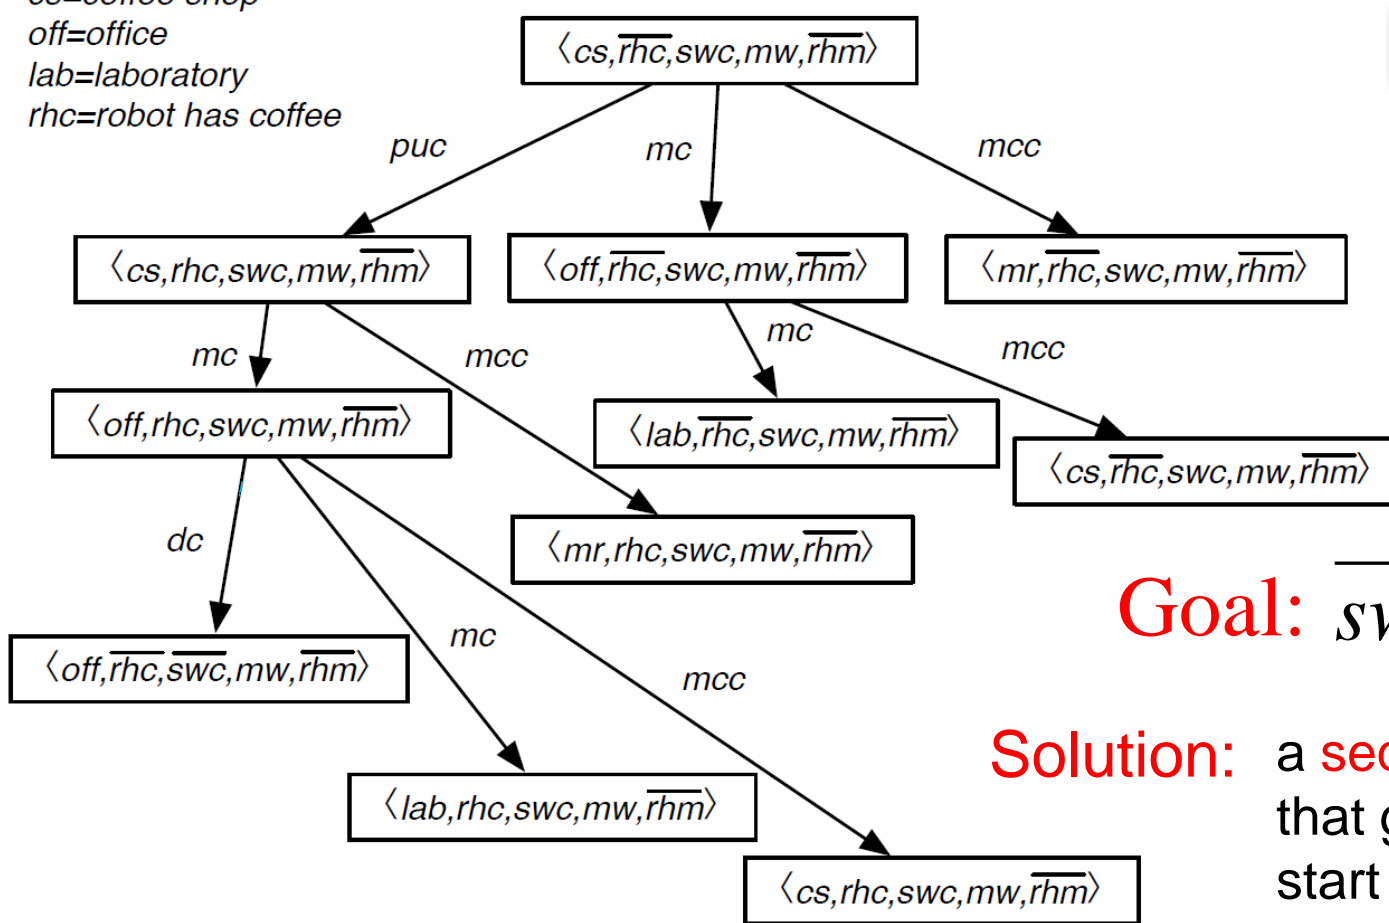

dm: deliver mail

Just two
to simplify the
example

Example for state space graph

cs=coffee shop
off=office
lab=laboratory
rhc=robot has coffee

Solution: a sequence of actions that gets us from the start to a goal

What is a solution to this planning problem?

(puc, mc)

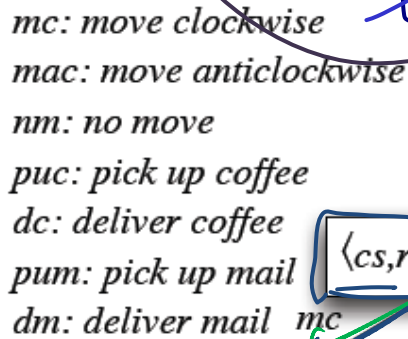

(puc, mc, mc)

(puc, dc)

(puc, mc, dc)

start
state

Goal: SWC

goal

 $\langle cs, \overline{rhc}, swc, mw, \overline{rhm} \rangle$

Coffee Shop

Sam's
Office

Mail
Room

ab

PLAN
3 options

puc,
mc,
dc,

mr, rhc,
swc, mw
rhv

Locations:

cs: coffee shop
off: office
lab: laboratory
mr: mail room

Feature values

rhc: robot has coffee
swc: Sam wants coffee
mw: mail waiting
rhm: robot has mail

Learning Goals for today's class

You can:

- Represent a planning problem with the **STRIPS** representation
 - Explain the **STRIPS** assumption
 - Solve a planning problem by search (**forward planning**). Specify states, successor function, goal test and solution.
- 

Next class

Finish Planning (Chp 8)

- Heuristics for planning (*not on textbook*) 
- Mapping planning problem into a CSP (8.4)

Course Announcements

- Start working on Assignment2 (CSP) – due Oct 22
- Work on Practice Exercises (under Aispace)
