

CPSC 421/501, Oct 8, 2020

Update to Zoom
5.3.0 or later to
choose your own
breakout rooms

- Myhill-Nerode

- $\{0^n 1^n\}$ is nonregular

- Implication:

$\{0^n 1^m 0^p \mid n+p=m\}$ is non-regular

(intersect with regular language $0^* 1^*$)

- Myhill-Nerode

- Min DFA for

$$L = a^{23} a^*$$

" " "

$$L = a^{23} a^* \cup \{a^0, a^1, a^5\}$$

Don't forget to carefully argue

that sets are distinct: e.g.

$\{\text{odd perfect numbers}\}$ vs. \emptyset

$\{0,1\}^*$ vs. $(\epsilon \cup 1)(1,0)^*(\epsilon \cup 0)$

Breakout Room Problems:

① Show that $L = \{0^{n^2} \mid n \in \mathbb{Z}\}$ is

nonregular $= \{0^1, 0^4, 0^9, 0^{16}, \dots\}$

② Show that $L = \{0^n 1^m \mid n, m \in \mathbb{Z}, n \geq 2m\}$

is non-regular

③ Show that

$L = \left\{ w \in \{a, b\}^* \mid \begin{array}{l} w \text{ has the same} \\ \text{number of } a\text{'s} \\ \text{as } b\text{'s} \end{array} \right\}$

is non-regular

④ If $w = \sigma_1 \dots \sigma_k$, then $w^{\text{reverse}} = \sigma_k \dots \sigma_1$

e.g. $(abb)^{\text{rev}} = bba$

Show that

$$\text{PALINDROME} = \left\{ w \in \{a,b\}^* \mid w = w^{\text{rev}} \right\}$$

is non-regular.

(5) Give a DFA with the few possible states accepting $(aab, ab)^*$:

(5a) Give the DFA

(5b) Use Myhill-Nerode to prove that your DFA has the fewest possible states.

Today finish Myhill-Nerode and §1.4 [Sip]
on nonregular languages [we are skipping the
"pumping lemma"].

Claim: The language $\{0^n 1^n \mid n \in \mathbb{N}\}$,
i.e. $\{01, 0011, 0^3 1^3, 0^4 1^4, \dots\}$ is nonregular, i.e.
is not recognized by any DFA.

Intuition: When you see $00\dots 0$ as input
you have to "count" how many 0's you seen

Proof: $\text{AccFut}_L(u) = \{v \in \Sigma^* \mid uv \in L\}$

$$\textcircled{1} \text{AccFut}_L(\varepsilon) = L = \{01, 0^2 1^2, 0^3 1^3, \dots\}$$

$$\begin{aligned} \text{AccFut}_L(0) &= \{v \mid 0v \in L\} \\ &= \{1, 011, 0^2 1^3, \dots\} \end{aligned}$$

$$\text{AccFut}_L(00) = \{11, 01^3, 0^2 1^4, \dots\}$$

$$\vdots$$

$$\text{AccFut}_L(0^k) = \{ 1^k, 01^{k+1}, 0^2 1^{k+2}, \dots \}$$

$$\vdots$$

(2) For any k , all set $\text{AccFut}_L(0^k)$ are distinct. Why:

$\Rightarrow \text{AccFut}_L(0^k)$ contains 1^k but no other element of 1^*

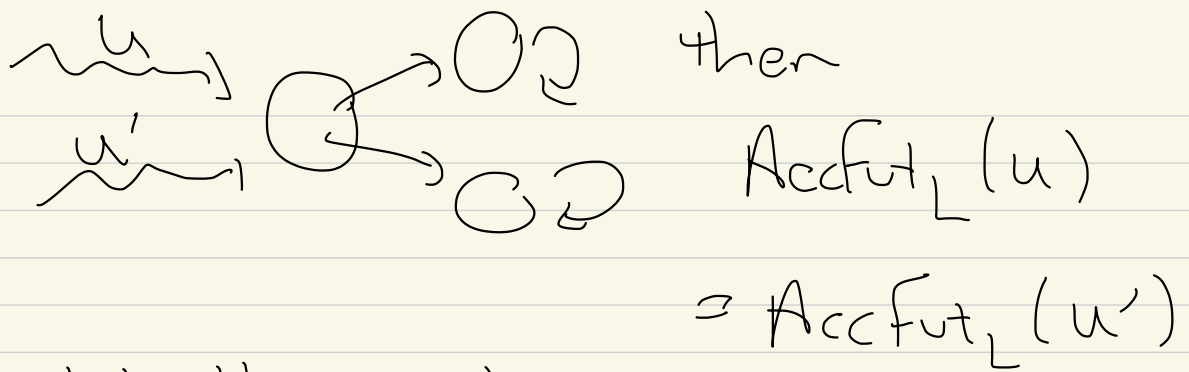

So if $k \neq k'$

$$\begin{cases} \text{AccFut}_L(0^k) & \text{contains } 1^k & \text{not } 1^{k'} \\ \text{AccFut}_L(0^{k'}) & \text{" } & 1^{k'} & \text{not } 1^k \end{cases}$$

- The short string in $\text{AccFut}_L(0^k)$ is of length k . (i.e. 1^k)

(3) If there are infinitely many sets of the form $\text{AccFut}_L(w)$ as w varies over $w \in \Sigma^*$, then L is non-regular

Recall: if w, w' fall in same DFA state

Myhill-Nerode thm.

One more tool! \cup, L

(1) Say we know $\{0^n 1^n\}$ is nonregular.

Claim: $\{w = 0^n 1^n 0^m \text{ s.t.}$

(2) $L' = \{w = 0^n 1^n 0^m \text{ s.t. } n \in \mathbb{N}, m = 0, 1, 2, \dots\}$

is non-regular

$$\{0^n 1^n\} \subset \{0, 1\}^*$$

non-regular

reg

$$w \in \{0^n 1^n\} \Rightarrow w \in \{0^n 1^n 0^m\}$$

$\underbrace{\hspace{10em}}_L \qquad \qquad \qquad \underbrace{\hspace{10em}}_{L'}$

(a) Still show $\text{Accfut}_L(O^k)$ are all distinct

(still shortest element of $\text{Accfut}_L(O^k)$ is length k)

(b) Say that $L' = \{O^n |^n O^m \mid \begin{matrix} n \in \mathbb{N} \\ m \in O_1^* |^* \end{matrix}\}$

is regular. Then

$$\begin{array}{ccc} L' \cap O^* |^* & = & \{O^n |^n\} \\ \uparrow & & \uparrow \\ \text{reg} & & \text{reg} \end{array}$$

we know this is not regular

Argument (b) takes non-regular languages (proven somehow) and gives you more non-regular languages.

Remark: If L' is non-regular

$L' \subseteq \Sigma^*$, and Σ^* is regular,

but if you want to prove that

L' is non-regular, and

$$L' \cap \left(\begin{array}{c} \text{some known} \\ \text{regular} \\ \text{language} \end{array} \right) = \left(\begin{array}{c} \text{some known} \\ \text{nonregular} \\ \text{language} \end{array} \right)$$

$\Rightarrow L'$ is nonregular

If L' is nonregular $\Rightarrow \Sigma^* \setminus L'$ is
nonregular

since reverse final states with nonfinal
states

$$\left(\underbrace{\{0^n | n\}}_{\text{non-regular}} \cup \underbrace{\left(\{0,1\}^* \setminus \{0^n | n\} \right)}_{\text{non-regular}} \right) = \underbrace{\{0,1\}^*}_{\text{regular}}$$

$$\left(\underbrace{\{\epsilon\}}_{\text{nonregular}} \cup \underbrace{\{0^n | n\}}_{\text{nonregular}} \right) \circ \underbrace{\left(\underbrace{\{\epsilon\}}_{\text{non-regular}} \cup \underbrace{\left(\{0,1\}^* \setminus \{0^n | n\} \right)}_{\text{non-regular}} \right)}_{\text{non-regular}}$$

$$= \{0,1\}^*$$

$$\left(\{\epsilon\} \circ L \right) \circ \left(\{\epsilon\} \cup \left(\Sigma^* \setminus L \right) \right) = \Sigma^*$$

$$\epsilon \in (\Sigma^* \setminus L)$$

OR

$$L \circ \epsilon$$

{ odd perfect numbers }

perfect numbers :

$\{ n \mid \text{sum of divisors of } n \text{ less than } n \} \text{ equals } n \}$

6 divisible by 1, 2, 3, (6)

$$1 + 2 + 3 = 6$$

28 divisible by 1, 2, 4, 7, 14

$$1 + 2 + 4 + 7 + 14 = 28$$

$\{ \text{odd perfect numbers} \} \stackrel{\text{conj}}{=} \emptyset$

not clear
if equal

$$L = a \{a, b\}^*$$

$$\text{Accept}_L(\text{a}) = \emptyset$$

but

$$(\{a, b\}^* \setminus \{a^n b^n\}) \cap \{a^m b^n\}$$

$$= \emptyset \cap \{\text{anything}\} = \left. \left\{ a^m \{a, b\}^* \mid \begin{array}{l} m \text{ is an} \\ \text{even prime} \\ \text{number} > 2 \end{array} \right\} \right\}$$

reg exp₁ reg exp₂

↑ ↗

these could describe some language

even if these expressions are

very different.

Suggest Probs (1) & (5) of

breakout problems

10:22 → 10:32

Show $\{0^{n^2} \mid n \in \mathbb{N}\} = L$

(1) = $\{0, 0^4, 0^9, 0^{16}, \dots\}$

is nonregular

Next Thursday I'll reserve Rooms 1-?

for random groups

$L' = \{0^{n_1}, 0^{n_2}, 0^{n_3}, \dots\}$ n_1, n_2, \dots
increasing

then

more general

$$\text{Accfut}_{L'}(0^{n_i}) = \{ \epsilon, 0^{n_{i+1} - n_i}, \dots \}$$

$$\text{Accfut}_L(0) = \{ \epsilon, 0^{4-1} = 0^3, 0^{9-1}, \dots \}$$

$$\text{Accfut}_L(0^4) = \{ \epsilon, 0^{9-4} = 0^5, \dots \}$$

$$\text{Accfut}_L(0^9) = \{ \epsilon, 0^{16-9} = 0^7, \dots \}$$

Claim: 2nd smallest string in

$$\text{Accfut}_L(0^{k^2}) \text{ is } 0^{2k+1}$$

$$\text{So if } k \neq k', \quad 0^{2k+1} \neq 0^{2k'+1}$$

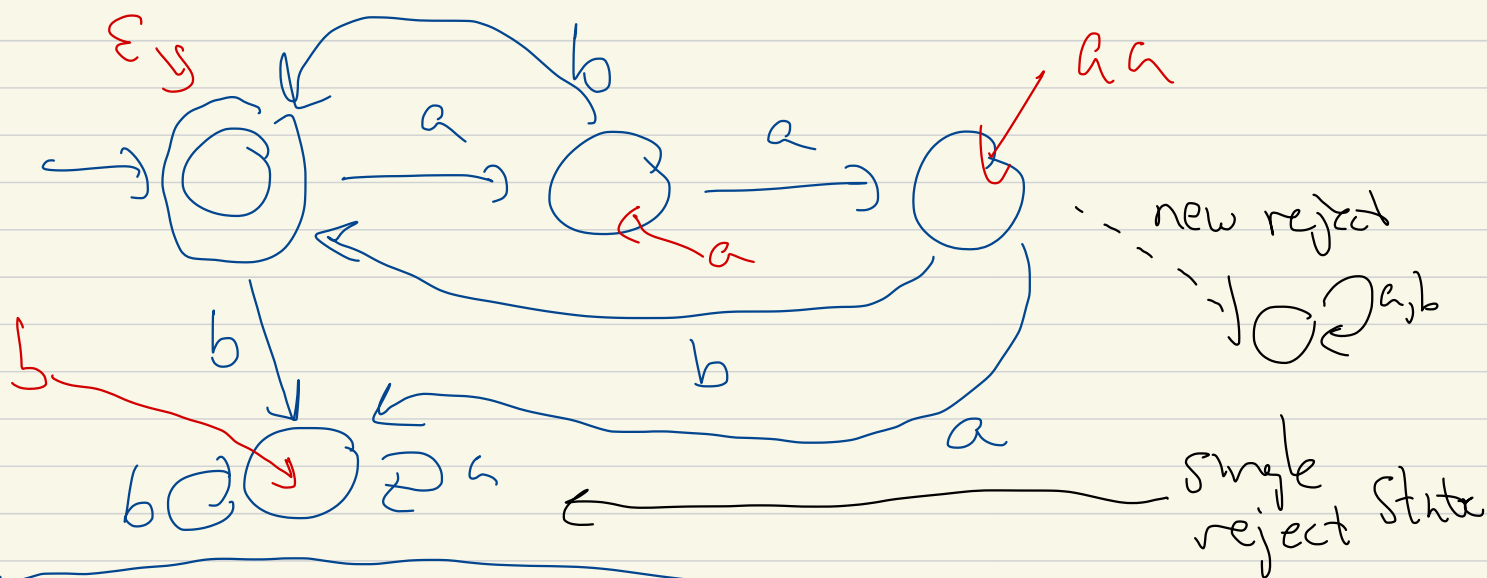

$$\text{hence } \text{Accfut}_L(0^{k^2}) \neq \text{Accfut}_L(0^{(k')^2})$$

By context $\{ \epsilon = 0^0, 0^7, 0^{14}, 0^{21}, 0^{28}, \dots \}$
is regular $\curvearrowright L'$

Acc Fut $\dots (O^k)$ depends only on $k \bmod 7$

(5) $(acb, ab)^*$: build a DFA

for language & use M-N thm
to show that your DFA has fewest
number of states

$$(acb, ab)^* = \{ \epsilon, ab, acb, abab, \dots \}$$

$$\text{Accfut}_L(\epsilon) = \{ \epsilon, ab, aab, \dots \}$$

$$\text{Accfut}_L(a) = \{ b, ab, \dots \}$$

$$\text{Accfut}_L(aa) = \{ b, bab, baab, \dots \}$$

$$\text{Accfut}_L(b) = \emptyset$$

← distinct,
since
all others
non-empty

distinct,
since
contains ϵ

shortest string is "b"

$$\text{Accfut}_L(a) \neq \text{Accfut}_L(aa)$$

ab ↑ in here

↗ not in here

End of class

If L is regular $\Leftrightarrow L^{\text{comp}}$ is regular

Thm: If L is non-regular $\Rightarrow \Sigma^* \setminus L$ is non-regular

PF: If L is non-regular, but $\Sigma^* \setminus L$ is

regular $\Rightarrow \Sigma^* \setminus (\Sigma^* \setminus L)$ is regular

L

$$L^{\text{comp}} = \sum^* \setminus L$$

$$(L^{\text{comp}})^{\text{comp}} = L$$

$\{ w \in \Sigma^* \mid \text{follow } w \text{ thru DFA get to } q_0 \}$

if wu leads to final/accepting state
and w, w' both lead to q_0

$\Rightarrow w'u$ leads to final/accepting state

accept at q_1

$$L = \{ a, a^3, a^5, \dots \}$$

If a^6 and $a^4 \rightarrow q_0$

then for any $w \in \{a\}^*$

either both a^6w and a^4w final state
 or " " " " " " non-final state

$$\begin{aligned}
 \text{Accept}_L(a^4) &= \{ w \mid a^4w \in L \} \\
 &= \text{Accept}_L(a^6) = \{ w \mid a^6w \in L \}
 \end{aligned}$$
