

CPSC 421/501, Sept 28, 2021

September 30:

National Day for Truth
and Reconciliation.

(concerning Canada's
residential school
system and related abuses)

also known as

Orange Shirt Day

UBC STEM (Science,
Coding, and Engineering)

invites you to their:

Intergenerational March

to commemorate Orange

Shirt Day, Sept 30,

11:45am - 2pm

- It is not easy for survivors of the Indian Residential School System to talk about their past trauma.

- Survivors and their families tire from giving repeated explanations

- Children are not responsible for the mistakes of their parents, but have the obligation to learn about these mistakes

- One of my favourite suggestions
"Learn for yourself"

I have learned.

We have learned.

We are learned.

Start Chapter 1:

1.1 DFA's & Regular Languages

1.2 Regular Languages are closed under \cup , $*$

e.g.

$\{a^4, a^5\}^*$ is regular

How do we know?

NFA's

1.3 Regular Expressions

← string search

~~1.4 skip~~, but handout of Myhill-Nerode thm

Def: A DFA, i.e. a
(deterministic) finite automaton,
(or finite automaton), is a
5-tuple $(Q, \Sigma, \delta, q_0, F)$
s.t. Q, Σ are finite sets,
 $\delta: Q \times \Sigma \rightarrow Q$ is a function,
 $q_0 \in Q$, and $F \subseteq Q$.

???

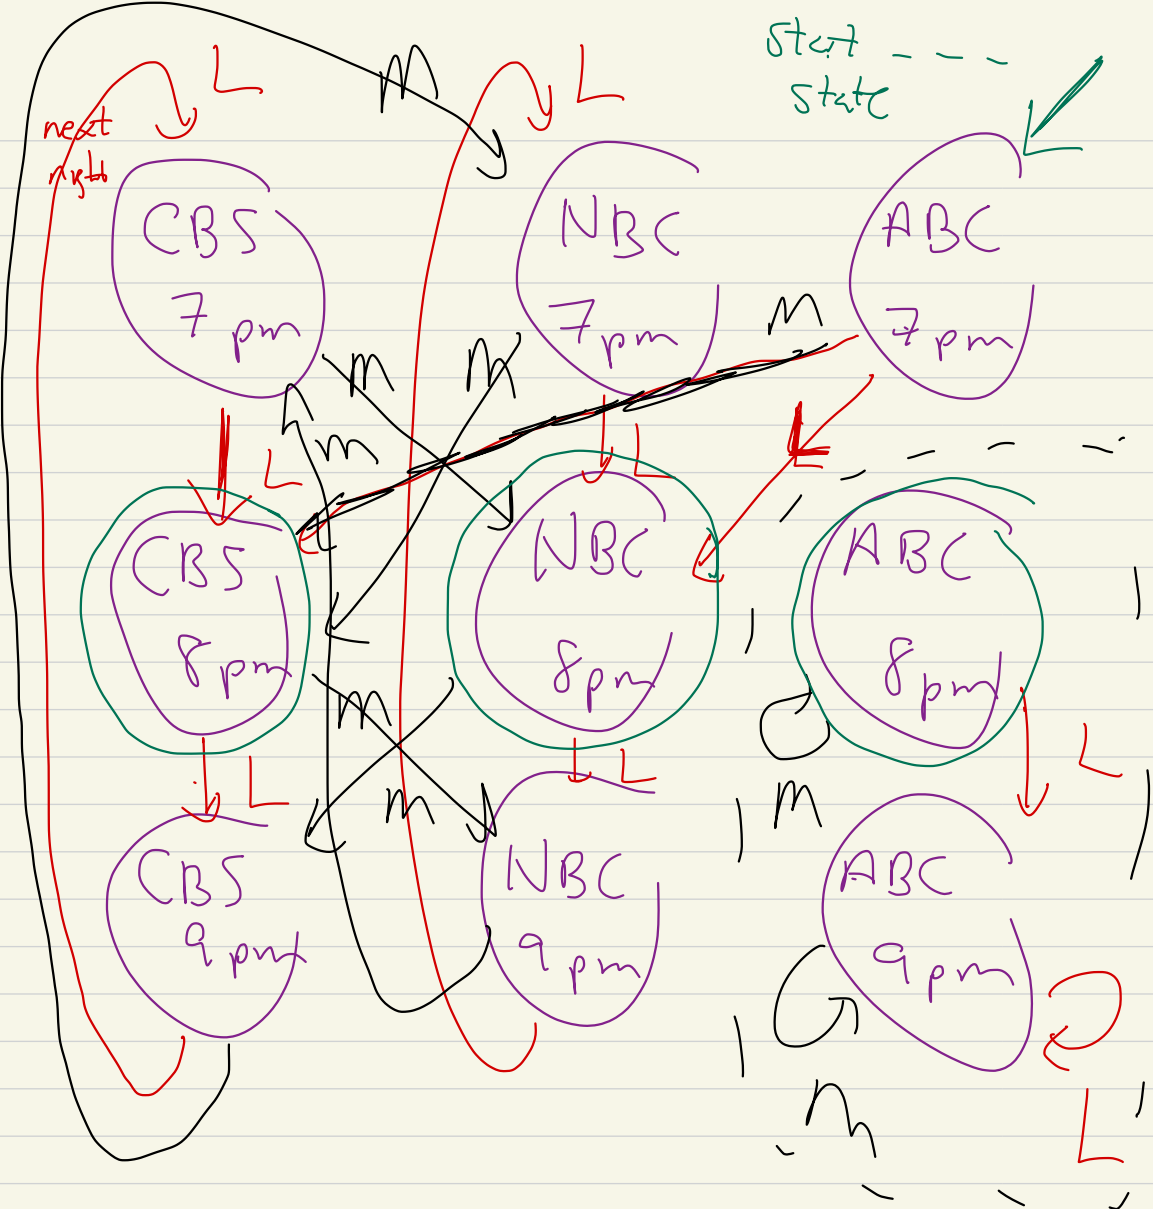

Start with examples...

Simple TV Watching of
mid 1970's:

3 major networks, WGN, PBS

ABC, CBS, NBC

Typical weeknight:

$$\Sigma = \{ L, \text{meh} \}$$

like
love

meh

A DFA is $(Q, \Sigma, \delta, q_0, F)$

① $Q = \{ \text{set of } \underline{\text{states}} \}$ of the DFA
here $\left\{ \begin{array}{cc} \text{CBS} & \text{CBS} \\ \text{7pm} & \text{8pm} \end{array} \right\}$

② $\Sigma = \underline{\text{alphabet}}$ of the DFA

③ $\delta: Q \times \Sigma \rightarrow Q$

transition function; idea

$\delta(q, \sigma) =$ the state you transition to when in state q

and you {read} or
{get}

(4) $q_0 \in Q$ designed as
the initial state

(5) $F \subset Q$ called

the {accepting}
final} states

=

Idea!

given q_0 initial state

→ \emptyset and a {word}
String}

over the alphabet Σ ,
take you to a state,
if you land in $F \subset Q$
then you state $\left\{ \begin{array}{l} \text{yes (accepted)} \\ \text{no (rejected)} \end{array} \right.$

Each DFA recognizes a
language $L \subset \Sigma^*$.

Goal: End of Ch 1 - find min
of states of a DFA

that recognizes a given
language

$$\left\{ \begin{array}{c} \text{DFA} \\ \uparrow \\ M = \text{machine} \end{array} \right\} \times \left\{ \begin{array}{c} \text{inputs} \\ = \Sigma^* \end{array} \right\} \rightarrow \left\{ \begin{array}{c} \text{yes} \\ \text{no} \end{array} \right.$$

Language (DFA)

$$:= \left\{ w \in \Sigma^* \mid w \text{ is accepted by } M \right\}$$

break for 5 minutes

10:11 - 10:16

① You want to find UBC in
a string over $\Sigma = \{B, C, U\}$

Given UUBBCCCCC ☹️

Given UUUUUUUUBCCCC ☺️

usually

$$Q = \{ \text{frowny face}, q_1, q_2, \text{smiley face} \}$$

$$\Sigma = \{ B, C, U \}$$

$$\delta: Q \times \Sigma \rightarrow Q$$

$$\delta(\text{frowny face}, U) = q_1$$

$$\delta(\text{frowny face}, B) = \text{frowny face}$$

$$\delta(\text{frowny face}, C) = \text{frowny face}$$

⋮

$$\delta: Q \times \Sigma \rightarrow Q$$

	B	C	U
q_0	q_1	q_1	q_1
q_1			
q_2			
q_3			

$$q_0 = \text{neutral face} \in Q$$

$$F = \{ \text{happy face} \}$$

Another example:

$$\Sigma = \{a\}$$

$$L = \{a^2\} = \{aa\}$$

$$L = \{a^3, a^4\} \quad \Sigma = \{a\}$$

Thm! If $L \subset \Sigma^*$ is
recognized by a DFA,
 M , i.e. for some M

we have

$$L = \left\{ \omega \in \Sigma^* \mid \begin{array}{l} \text{on input } \omega, \\ \text{the DFA, } M, \\ \text{accepts } \omega \\ \text{YES} \end{array} \right\}$$

then there is a DFA, M' ,
that recognizes

$$L^* \stackrel{\text{def}}{=} \left\{ \begin{array}{l} \text{all strings that are} \\ \text{concatenations of} \\ \text{elements of } L \end{array} \right\}$$

$$= \left\{ \omega_1 \dots \omega_k \mid \omega_1, \dots, \omega_k \in L \right\}$$

We view

$$L \subset \Sigma^*$$

as a "problem" to solve,

i.e. we want a DFA

$$M = (Q, \Sigma, \delta, q_0, F)$$

s.t.

$$L = \left\{ w \in \Sigma^* \mid \begin{array}{l} M \text{ accepts} \\ w \end{array} \right\}$$

Def $L \subset \Sigma^*$ is regular

if there is a DFA that

recognizes L .

Regular Languages

include

$$\Sigma = \{a, b, c\}$$

{ strings, w , over a, b, c s.t. some
substring of w equals abc }

$$\{a^2\} \subset \Sigma^*, \Sigma = \{a\}$$

$$\{a^3, a^4\} = \{aaa, aaaa\}$$
$$\subset \Sigma^*, \Sigma = \{a\}$$

are all regular.

Non-regular languages $\left\{ \begin{array}{l} 1.4 \text{ [sip]} \\ \text{Myhill-Nerode} \end{array} \right.$

e.g. $\Sigma = \{a\}$

$\left\{ w = a^n \mid n \text{ is prime} \right\}$

=

$\left\{ a^2, a^3, a^5, a^7, a^{11}, \dots \right\}$

is not regular, or non-regular
