Pareto Optimality

Best Response and Nash Equilibrium

# Defining Games

- ▶ Finite,  $n$ -person game:  $\langle N, A, u \rangle$ :
  - ▶  $N$  is a finite set of  $n$  **players**, indexed by  $i$
  - ▶  $A = \langle A_1, \dots, A_n \rangle$  is a tuple of **action sets** for each player  $i$ 
    - ▶  $a \in A$  is an **action profile**
  - ▶  $u = \langle u_1, \dots, u_n \rangle$ , a **utility function** for each player, where  $u_i : A \mapsto \mathbb{R}$
- ▶ Writing a 2-player game as a **matrix**:
  - ▶ row player is player 1, column player is player 2
  - ▶ rows are actions  $a \in A_1$ , columns are  $a' \in A_2$
  - ▶ cells are outcomes, written as a tuple of utility values for each player

# Prisoner's dilemma

Prisoner's dilemma is any game

	<i>C</i>	<i>D</i>
<i>C</i>	$a, a$	$b, c$
<i>D</i>	$c, b$	$d, d$

with  $c > a > d > b$ .

# Matching Pennies

A zero-sum game: players have **exactly opposed** interests.  
One player wants to **match**; the other wants to **mismatch**.

	Heads	Tails
Heads	1	-1
Tails	-1	1

# Coordination Game

A cooperative game: players have **exactly the same** interests.  
Which **side of the road** should you drive on?

	Left	Right
Left	1	0
Right	0	1

Recap

One more example

Pareto Optimality

Best Response and Nash Equilibrium

# General Games: Battle of the Sexes

The most interesting games combine elements of *cooperation and competition*.

	B	F
B	2, 1	0, 0
F	0, 0	1, 2

# General Games: Battle of the Sexes

The most interesting games combine elements of *cooperation and competition*.

	B	F
B	2, 1	0, 0
F	0, 0	1, 2

Play this game with someone near you, repeating five times.

Pareto Optimality

Best Response and Nash Equilibrium

# Analyzing Games

- ▶ We've defined some canonical games, and thought about how to play them. Now let's examine the games from the **outside**
- ▶ From the point of view of an outside observer, can some outcomes of a game be said to be **better** than others?

# Analyzing Games

- ▶ We've defined some canonical games, and thought about how to play them. Now let's examine the games from the **outside**
- ▶ From the point of view of an outside observer, can some outcomes of a game be said to be **better** than others?
  - ▶ we have no way of saying that one agent's interests are more important than another's
  - ▶ intuition: imagine trying to find the revenue-maximizing outcome when you don't know what currency has been used to express each agent's payoff
- ▶ Are there situations where we can still prefer one outcome to another?

# Pareto Optimality

- ▶ **Idea:** sometimes, one outcome  $o$  is at least as good for every agent as another outcome  $o'$ , and there is some agent who strictly prefers  $o$  to  $o'$ 
  - ▶ in this case, it seems reasonable to say that  $o$  is better than  $o'$
  - ▶ we say that  $o$  **Pareto-dominates**  $o'$ .

# Pareto Optimality

- ▶ **Idea:** sometimes, one outcome  $o$  is at least as good for every agent as another outcome  $o'$ , and there is some agent who strictly prefers  $o$  to  $o'$ 
  - ▶ in this case, it seems reasonable to say that  $o$  is better than  $o'$
  - ▶ we say that  $o$  **Pareto-dominates**  $o'$ .
  
- ▶ An outcome  $o^*$  is **Pareto-optimal** if there is no other outcome that Pareto-dominates it.

# Pareto Optimality

- ▶ **Idea:** sometimes, one outcome  $o$  is at least as good for every agent as another outcome  $o'$ , and there is some agent who strictly prefers  $o$  to  $o'$ 
  - ▶ in this case, it seems reasonable to say that  $o$  is better than  $o'$
  - ▶ we say that  $o$  **Pareto-dominates**  $o'$ .
  
- ▶ An outcome  $o^*$  is **Pareto-optimal** if there is no other outcome that Pareto-dominates it.
  - ▶ can a game have more than one Pareto-optimal outcome?

# Pareto Optimality

- ▶ **Idea:** sometimes, one outcome  $o$  is at least as good for every agent as another outcome  $o'$ , and there is some agent who strictly prefers  $o$  to  $o'$ 
  - ▶ in this case, it seems reasonable to say that  $o$  is better than  $o'$
  - ▶ we say that  $o$  **Pareto-dominates**  $o'$ .
  
- ▶ An outcome  $o^*$  is **Pareto-optimal** if there is no other outcome that Pareto-dominates it.
  - ▶ can a game have more than one Pareto-optimal outcome?
  - ▶ does every game have at least one Pareto-optimal outcome?

# Pareto Optimal Outcomes in Example Games

	<i>C</i>	<i>D</i>
<i>C</i>	-1, -1	-4, 0
<i>D</i>	0, -4	-3, -3

# Lecture Overview

Recap

One more example

Pareto Optimality

Best Response and Nash Equilibrium

# Best Response

- ▶ If you knew what everyone else was going to do, it would be easy to pick your own action

# Best Response

- ▶ If you knew what everyone else was going to do, it would be easy to pick your own action
- ▶ Let  $a_{-i} = \langle a_1, \dots, a_{i-1}, a_{i+1}, \dots, a_n \rangle$ .
  - ▶ now  $a = (a_{-i}, a_i)$
  
- ▶ **Best response:**  $a_i^* \in BR(a_{-i})$  iff
$$\forall a_i \in A_i, u_i(a_i^*, a_{-i}) \geq u_i(a_i, a_{-i})$$

# Nash Equilibrium

- ▶ Now let's return to the setting where no agent knows anything about what the others will do
- ▶ What can we say about which actions will occur?

# Nash Equilibrium

- ▶ Now let's return to the setting where no agent knows anything about what the others will do
- ▶ What can we say about which actions will occur?
  
- ▶ Idea: look for **stable** action profiles.
- ▶  $a = \langle a_1, \dots, a_n \rangle$  is a **Nash equilibrium** iff  $\forall i, a_i \in BR(a_{-i})$ .

## Nash Equilibria of Example Games

	$C$	$D$
$C$	$-1, -1$	$-4, 0$
$D$	$0, -4$	$-3, -3$
