Lecture 10: Corner Detection (cont)

(unless otherwise stated slides are taken or adopted from **Bob Woodham, Jim Little** and **Fred Tung**)

Menu for Today (February 5, 2019)

Topics:

- Harris **Corner** Detector (review)
- **Blob** Detection
- Searching over **Scale**

Readings:

- **Today's** Lecture: Forsyth & Ponce (2nd ed.) 5.3, 6.1, 6.3
- **Next** Lecture: Forsyth & Ponce (2nd ed.) 3.1-3.3

Reminders:

- **Assignment 2:** Face Detection in a Scaled Representation is **February 8th**
- **Office** hours; Posted link to **online lectures** from UCF

Today's “**fun**” Example: Rainbow Illusion

Today's “**fun**” Example: Lilac Chaser (a.k.a. Pac-Man) Illusion

Lecture 9: Re-cap (Harris Corner Detection)

1. Compute image gradients over small region
2. Compute the covariance matrix
3. Compute eigenvectors and eigenvalues
4. Use threshold on eigenvalues to detect corners

$$I_x = \frac{\partial I}{\partial x}$$

$$I_y = \frac{\partial I}{\partial y}$$

$$\begin{bmatrix} \sum_{p \in P} I_x I_x & \sum_{p \in P} I_x I_y \\ \sum_{p \in P} I_y I_x & \sum_{p \in P} I_y I_y \end{bmatrix}$$

Lecture 9: Re-cap (compute image gradients at patch)

(not just a single pixel)

array of x gradients

$$I_x = \frac{\partial I}{\partial x}$$

array of y gradients

$$I_y = \frac{\partial I}{\partial y}$$

Lecture 9: Re-cap (compute the covariance matrix)

Sum over small region
around the corner

Gradient with respect to x , times
gradient with respect to y

$$C = \begin{bmatrix} \sum_{p \in P} I_x I_x & \sum_{p \in P} I_x I_y \\ \sum_{p \in P} I_y I_x & \sum_{p \in P} I_y I_y \end{bmatrix}$$

Matrix is **symmetric**

Lecture 9: Re-cap

It can be shown that since every C is symmetric:

$$C = \begin{bmatrix} \sum_{p \in P} I_x I_x & \sum_{p \in P} I_x I_y \\ \sum_{p \in P} I_y I_x & \sum_{p \in P} I_y I_y \end{bmatrix} = R^{-1} \begin{bmatrix} \lambda_1 & 0 \\ 0 & \lambda_2 \end{bmatrix} R$$

Lecture 9: Re-cap (**Threshold** on Eigenvalues to **Detect Corners**)

Harris & Stephens (1988)

$$\det(C) - \kappa \text{trace}^2(C)$$

Kanade & Tomasi (1994)

$$\min(\lambda_1, \lambda_2)$$

Nobel (1998)

$$\frac{\det(C)}{\text{trace}(C) + \epsilon}$$

Harris Corner Detection Review

- Filter image with **Gaussian**
- Compute magnitude of the x and y **gradients** at each pixel
- Construct C in a window around each pixel
 - Harris uses a **Gaussian window**
- Solve for product of the λ 's
- If λ 's both are big (product reaches local maximum above threshold) then we have a corner
 - Harris also checks that ratio of λ s is not too high

Harris & Stephens (1988)

$$\det(C) - \kappa \text{trace}^2(C)$$

Properties: Rotational Invariance

Ellipse rotates but its shape
(**eigenvalues**) remains the same

Corner response is **invariant** to image rotation

Properties: (partial) Invariance to Intensity Shifts and Scaling

Only derivatives are used -> Invariance to intensity shifts

Intensity scale could effect performance

Properties: NOT Invariant to Scale Changes

edge!

corner!

Intuitively ...

Find local maxima in both **position** and **scale**

Formally ...

Laplacian filter

Original signal

Convolved with Laplacian ($\sigma = 1$)

Highest response when the signal has the same **characteristic scale** as the filter

Characteristic Scale

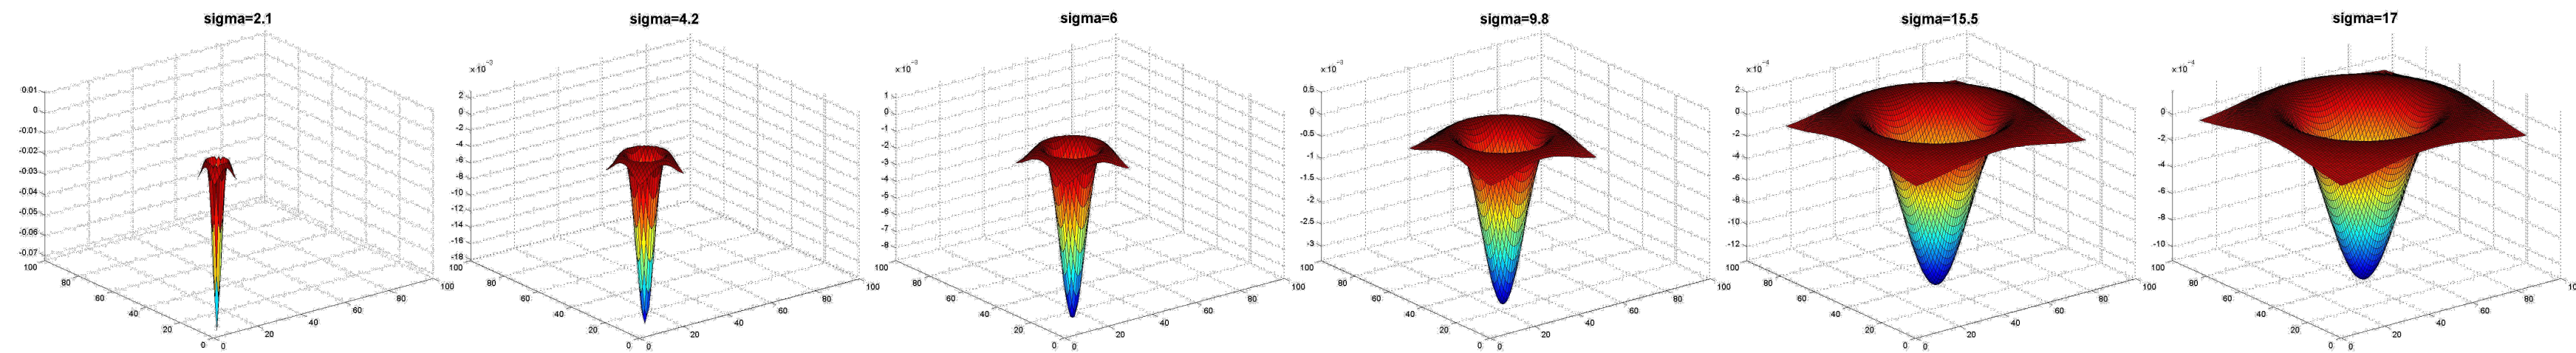

characteristic scale - the scale that produces peak filter response

characteristic scale

we need to search over characteristic scales

Implementation

For each level of the Gaussian pyramid
compute feature response (e.g. Harris, Laplacian)

For each level of the Gaussian pyramid
if local maximum and cross-scale
save scale and location of feature (x, y, s)

Summary

A **corner** is a distinct 2D feature that can be localized reliably

Edge detectors perform poorly at corners

→ consider corner detection directly

Harris corner detection

- corners are places where intensity gradient direction takes on multiple distinct values

- interpret in terms of autocorrelation of local window

- translation and rotation invariant, but not scale invariant
