## CPSC 425: Computer Vision

Image Credit: https://en.wikipedia.org/wiki/Corner detection

Lecture 11: Corner Detection (cont.)
( unless otherwise stated slides are taken or adopted from Bob Woodham, Jim Little and Fred Tung )

## Menu for Today

## Topics:

- Harris Corner Detector (review)
- Blob Detection
- Searching over Scale
- Texture Synthesis \& Analysis

## Readings:

- Today’s Lecture: Forsyth \& Ponce (2nd ed.) 5.3, 6.1, 6.3, 3.1-3.3

## Reminders:

- Assignment 2: Face Detection in a Scaled Representation is due today
- Assignment 3: Texture Synthesis is out today
- Study questions for Midterm are on Canvas (answers on Friday)
- (practice) Quiz 1 is on Canvas, Quiz 2 \& 3 coming

## Today’s "fun" Example: Texture Camouflage

https://en.wikipedia.org/wiki/File:Camouflage.jpg

## Today’s "fun" Example: Texture Camouflage

Cuttlefish on gravel seabed

Seconds later...

## Lecture 10: Re-cap (Harris Corner Detection)

1.Compute image gradients over small region
2.Compute the covariance matrix
3.Compute eigenvectors and eigenvalues
4.Use threshold on eigenvalues to detect corners

$$
\left[\begin{array}{cc}
\sum_{p \in P} I_{x} I_{x} & \sum_{p \in P} I_{x} I_{y} \\
\sum_{p \in P} I_{y} I_{x} & \sum_{p \in P} I_{y} I_{y}
\end{array}\right]
$$

## Lecture 10: Re-cap (compute image gradients at patch)

(not just a single pixel)

$$
\begin{aligned}
& \text { array of } \mathrm{x} \text { gradients } \\
& I_{x}=\frac{\partial I}{\partial x} \\
& \text { array of } \mathrm{y} \text { gradients } \\
& I_{y}=\frac{\partial I}{\partial y}
\end{aligned}
$$

## Lecture 10: Re-cap (compute the covariance matrix)

Sum over small region around the corner

$$
C=\left[\begin{array}{ll}
\sum_{p \in P} I_{x} I_{x} & \sum_{p \in P} I_{x} I_{y} \\
\sum_{p \in P} I_{y} I_{x} & \sum_{p \in P} I_{y} I_{y}
\end{array}\right]
$$

Gradient with respect to $x$, times gradient with respect to $y$

Matrix is symmetric

## Lecture 10: Re-cap

It can be shown that since every $C$ is symmetric:

$$
C=\left[\begin{array}{cc}
\sum_{p \in P} I_{x} I_{x} & \sum_{p \in P} I_{x} I_{y} \\
\sum_{p \in P} I_{y} I_{x} & \sum_{p \in P} I_{y} I_{y}
\end{array}\right]=R^{-1}\left[\begin{array}{cc}
\lambda_{1} & 0 \\
0 & \lambda_{2}
\end{array}\right] R
$$

## Lecture 10: Re-cap (computing eigenvalues and eigenvectors)

$$
\begin{gathered}
\text { eigenvalue } \\
\downarrow \\
C e=\lambda e \\
\text { eigenvector }
\end{gathered}
$$

$$
(C-\lambda I) e=0
$$

(returns a polynomial)

$$
C-\lambda I
$$

2. Find the roots of polynomial (returns eigenvalues)

$$
\operatorname{det}(C-\lambda I)=0
$$

3. For each eigenvalue, solve (returns eigenvectors)

$$
(C-\lambda I) e=0
$$

## Lecture 10: Re-cap (interpreting eigenvalues)

## Lecture 10: Re-cap (Threshold on Eigenvalues to Detect Corners)

# Think of a function to score 'cornerness' 

## Lecture 10: Re-cap (Threshold on Eigenvalues to Detect Corners)

Harris \& Stephens (1988)

$$
\operatorname{det}(C)-\kappa \operatorname{trace}^{2}(C)
$$

Kanade \& Tomasi (1994)

```
min}(\mp@subsup{\lambda}{1}{},\mp@subsup{\lambda}{2}{}
```

Nobel (1998) $\operatorname{det}(C)$
$\operatorname{trace}(C)+\epsilon$

## Example: Harris Corner Detection

| 0 | 0 | 0 | 0 | 0 | 0 | 0 |

## Harris Corner Detection Review

- Filter image with Gaussian
- Compute magnitude of the $x$ and $y$ gradients at each pixel
- Construct $C$ in a window around each pixel
- Harris uses a Gaussian window
- Solve for product of the $\lambda$ 's

> Harris \& Stephens (1988)

$$
\operatorname{det}(C)-\kappa \operatorname{trace}^{2}(C)
$$

- If $\lambda$ 's both are big (product reaches local maximum above threshold) then we have a corner
- Harris also checks that ratio of $\lambda$ s is not too high

## Compute the Covariance Matrix

Sum can be implemented as an
(unnormalized) box filter with

$$
C=\left[\begin{array}{cc}
\sum_{p \in P} I_{x} I_{x} & \sum_{p \in P} I_{x} I_{y} \\
\sum_{p \in P} I_{y} I_{x} & \sum_{p \in P} I_{y} I_{y}
\end{array}\right]
$$

Harris uses a Gaussian weighting instead

## Properties: Rotational Invariance

Ellipse rotates but its shape (eigenvalues) remains the same

## Properties: (partial) Invariance to Intensity Shifts and Scaling

Only derivatives are used -> Invariance to intensity shifts
Intensity scale could effect performance

Slide Credit: Ioannis (Yannis) Gkioulekas (CMU)

## Properties: NOT Invariant to Scale Changes

edge!

corner!

## Example 2: Wagon Wheel (Harris Results)

$\sigma=1$ (219 points)

$\sigma=2(155$ points $)$

$\sigma=3(110$ points $)$

$\sigma=4$ (87 points)

## Example 3: Crash Test Dummy (Harris Result)

corner response image

$\sigma=1$ (175 points)

## Example 2: Wagon Wheel (Harris Results)

$\sigma=1$ (219 points)

$\sigma=2(155$ points $)$

$\sigma=3(110$ points $)$

$\sigma=4$ (87 points)

## Intuitively ...

Slide Credit: Ioannis (Yannis) Gkioulekas (CMU)

## Intuitively ...

Find local maxima in both position and scale

## Non-maxima Suppression in Template Matching

Idea: suppress near-by similar detections to obtain one "true" result

Detected template

Correlation map

## Implementation

For each level of the Gaussian pyramid compute feature response (e.g. Harris, Laplacian)

For each level of the Gaussian pyramid
if local maximum and cross-scale
save scale and location of feature $(x, y, s)$

## Multi-Scale Harris Corners

## Re-cap

Summary of what we have seen so far:

| Representation | Results in | Approach | Technique |
| :---: | :---: | :---: | :---: |
| intensity | dense | template matching | (normalized) correlation |
| edge | relatively sparse | derivatives | Sobel, LoG, Canny |
| corner | sparse | locally distinct features | Harris (and variants) |
| blob | sparse | locally distinct features | LoG |

## Re-cap

Summary of what we have seen so far:

| Representation | Results in | Approach | Technique |
| :---: | :---: | :---: | :---: |
| intensity | dense | template matching | (normalized) correlation |
| edge | relatively sparse | derivatives | Sobel, LoG, Canny |
| corner | sparse | locally distinct features | Harris (and variants) |
| blob | sparse | locally distinct features | LoG |

## Re-cap

Summary of what we have seen so far:

| Representation | Results in | Approach | Technique |
| :---: | :---: | :---: | :---: |
| intensity | dense | template matching | (normalized) correlation |
| edge | relatively sparse | derivatives | Sobel, LoG, Canny |
| corner | sparse | locally distinct features | Harris (and variants) |
| blob | sparse | locally distinct features | LoG |

## Summary

Edges are useful image features for many applications, but suffer from the aperture problem

Canny Edge detector combines edge filtering with linking and hysteresis steps
Corners / Interest Points have 2D structure and are useful for correspondence

Harris corners are minima of a local SSD function
DoG maxima can be reliably located in scale-space and are useful as interest points
