

CPSC 425: Computer Vision

Lecture 2: Image Formation

(unless otherwise stated slides are taken or adopted from **Bob Woodham, Jim Little** and **Fred Tung**)

Menu for Today (January 7, 2025)

Topics:

- Image Formation
- Cameras and Lenses
- Projection
- Human Eye ??

Readings:

- **Today's** Lecture: Szeliski Chapter 2, Forsyth & Ponce (2nd ed.) 1.1.1 — 1.1.3
- **Next** Lecture: Forsyth & Ponce (2nd ed.) 4.1, 4.5

Reminders:

- Complete **Assignment 0** (ungraded) by Tuesday, **January 13**
- **Assignment 1** (graded) will be out Tuesday, **January 13**
- Please sign up for **Piazza** (if you have not done it)

Today's “**fun**” Example

Lecture 2: Goal

To understand how images are formed

(and develop relevant mathematical
concepts and abstractions)

What is **Computer Vision**?

Computer vision, broadly speaking, is a research field aimed to enable computers to **process and interpret visual data**, as sighted humans can.

Image (or video)

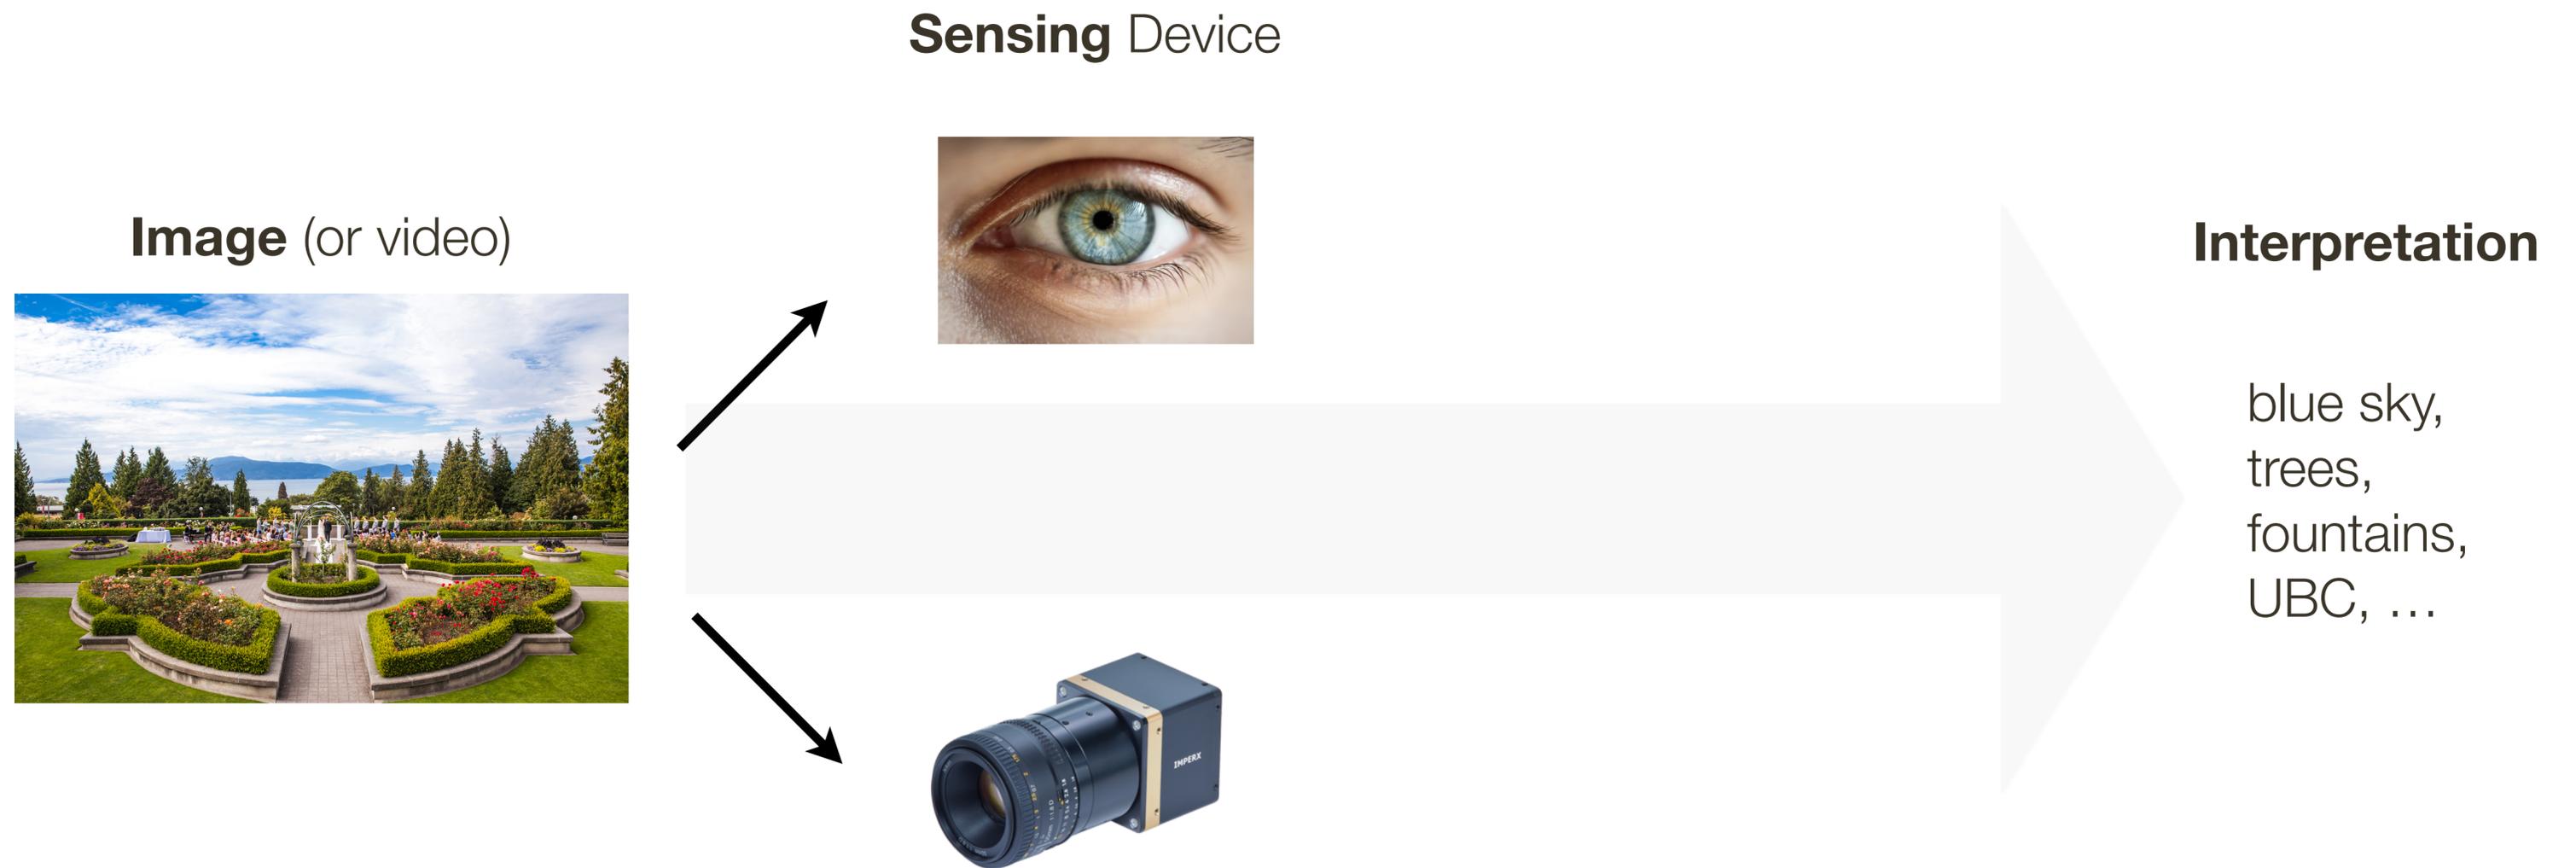

Interpretation

blue sky,
trees,
fountains,
UBC, ...

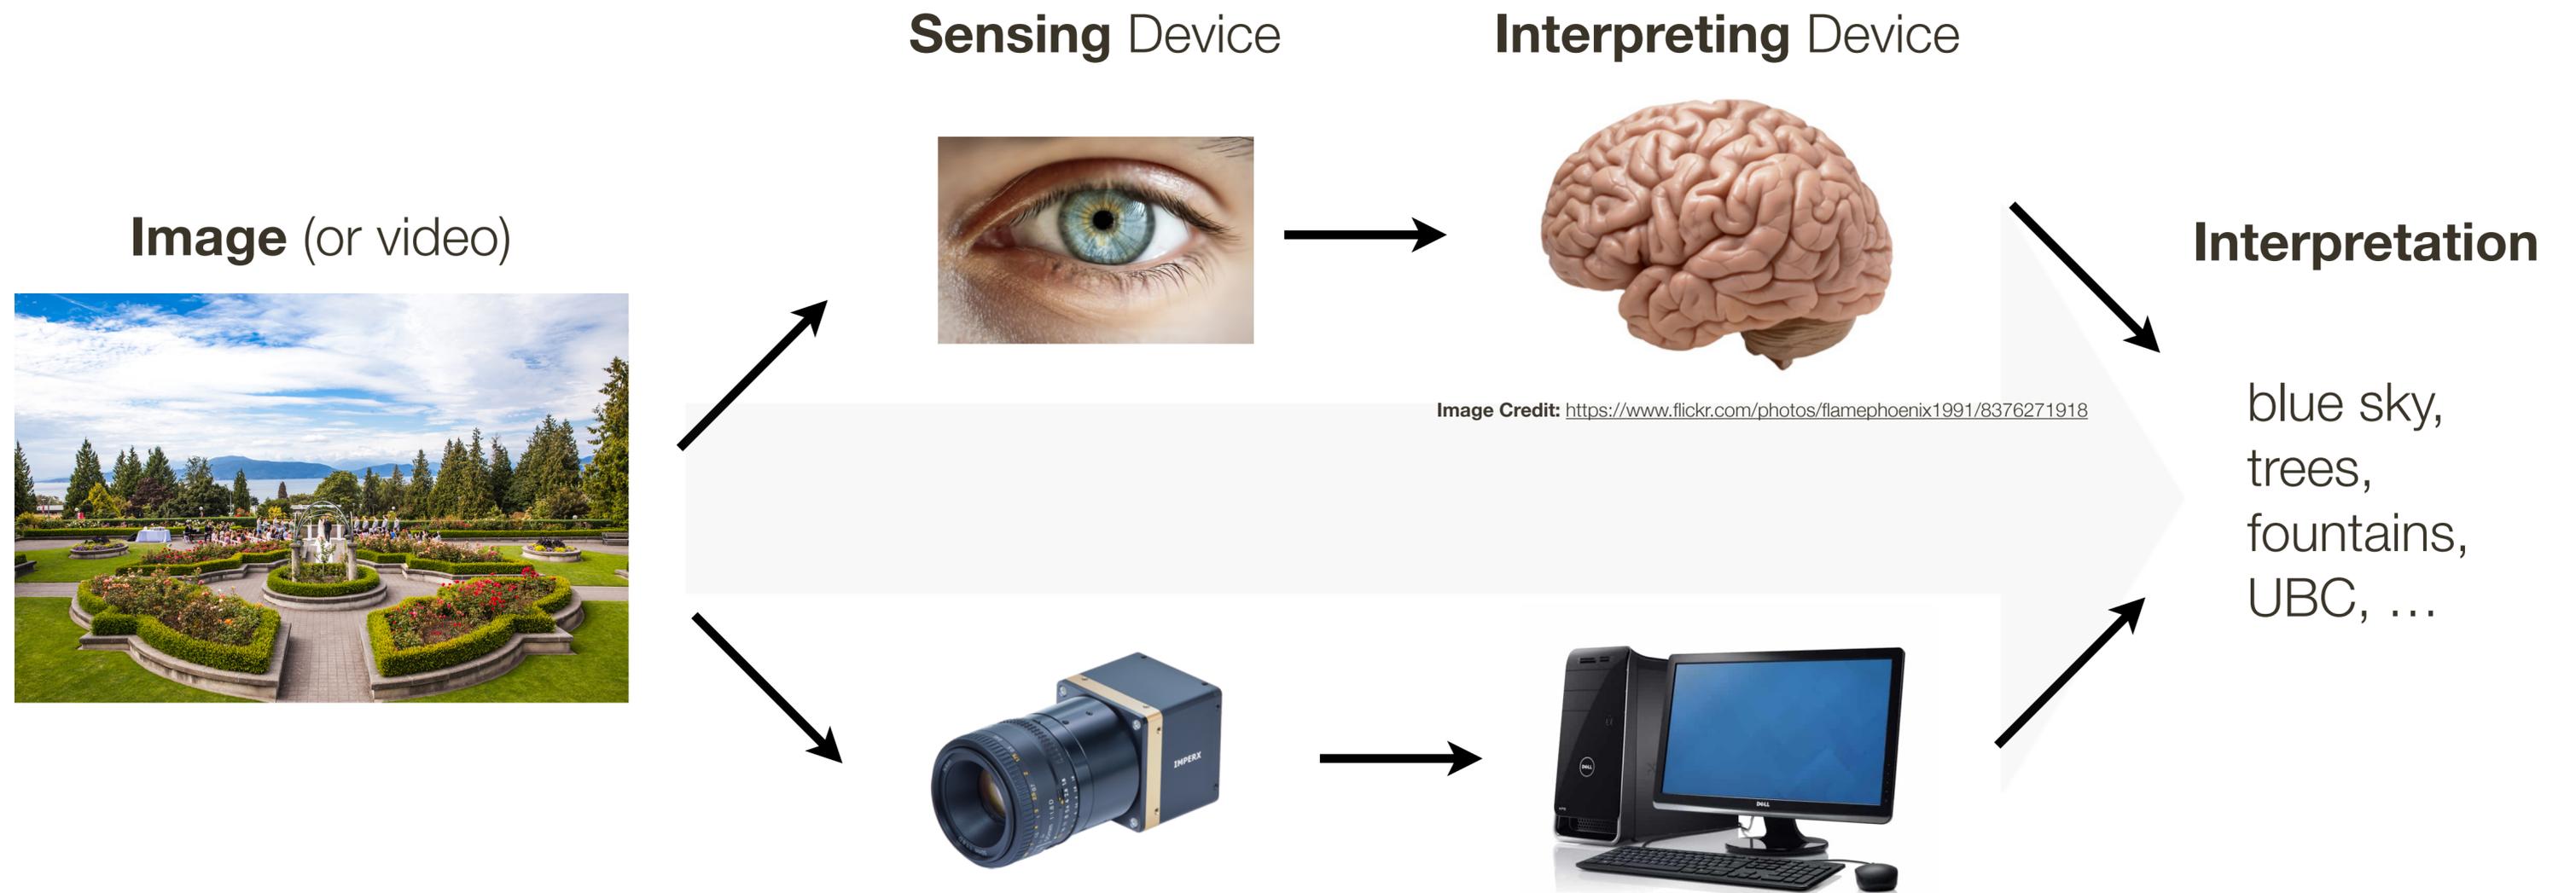

What is **Computer Vision**?

Sensing Device

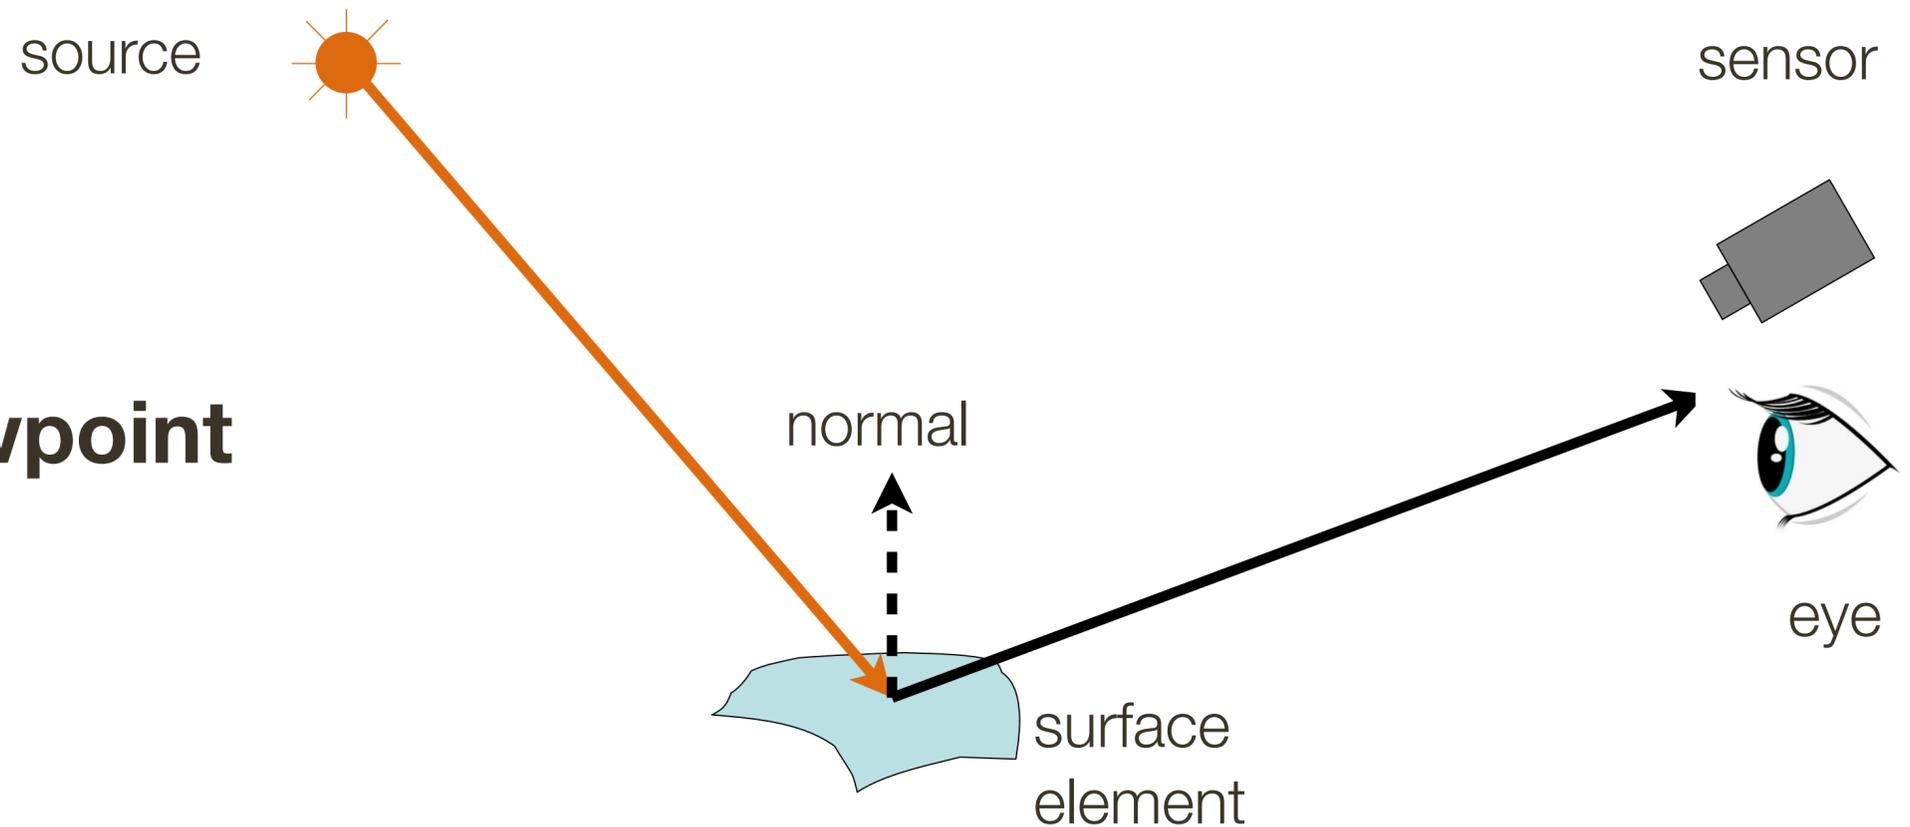

Image (or video)

Overview: Image Formation, Cameras and Lenses

The **image formation process** that produces a particular image depends on

- **Lighting** condition
- Scene **geometry**
- **Surface** properties
- Camera **optics** and **viewpoint**

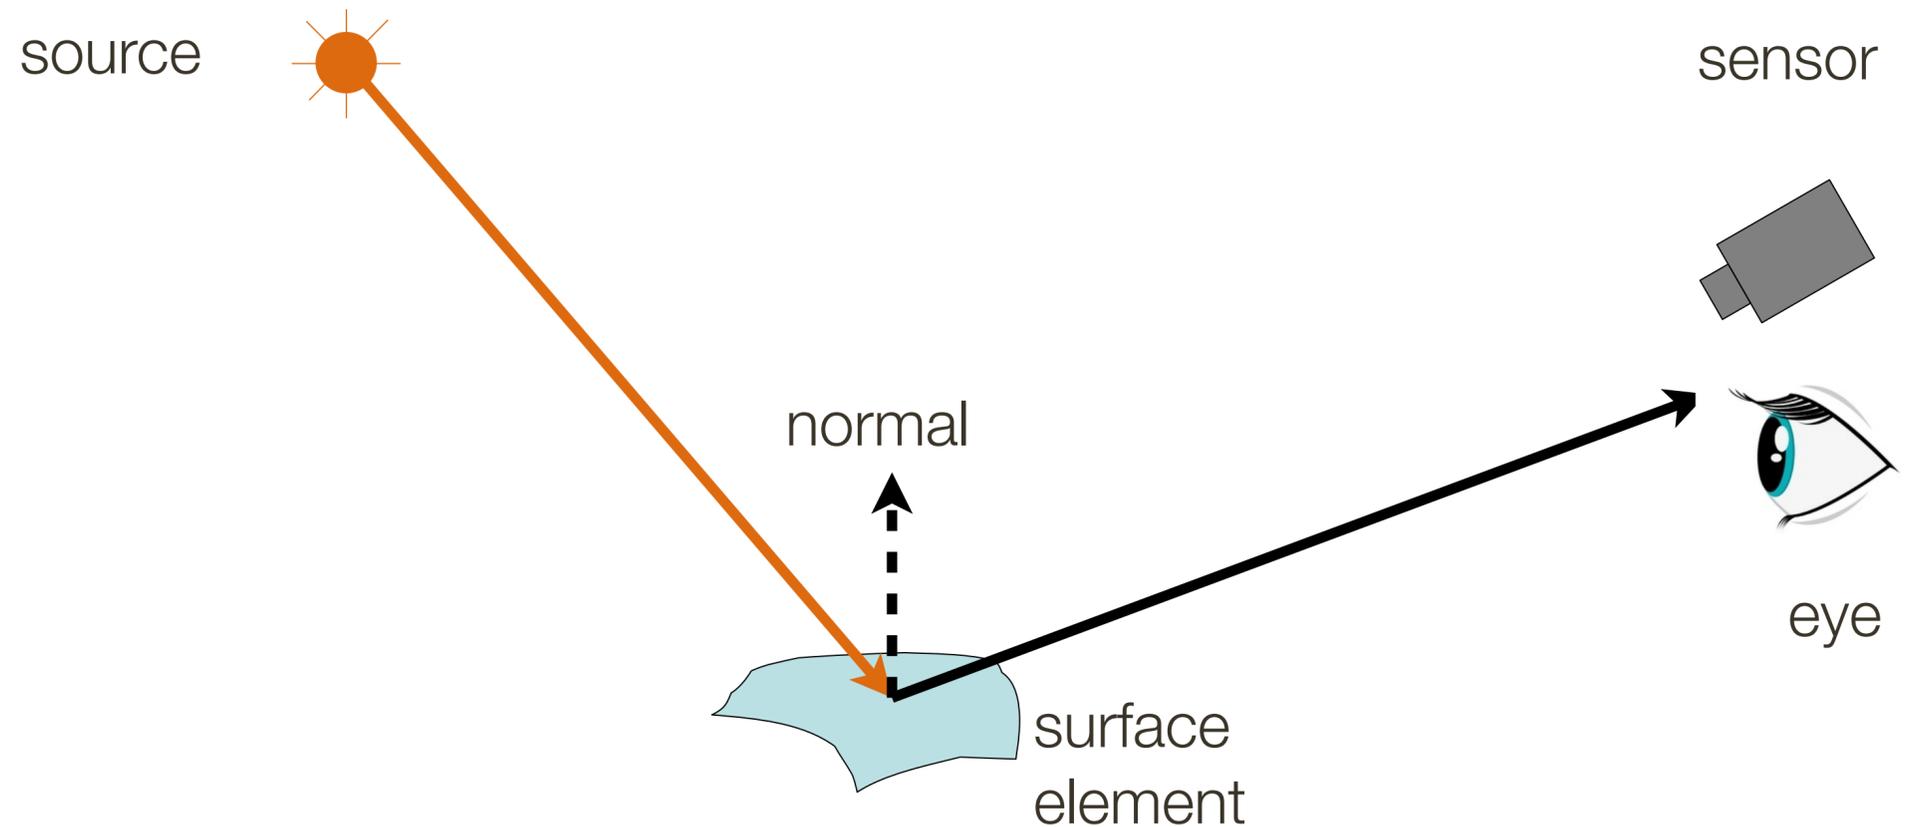

Sensor (or eye) **captures amount of light** reflected from the object

Overview: Image Formation, Cameras and Lenses

Light and Color: A Short Preview

Visible light is electromagnetic radiation in the 400nm-700nm band of wavelengths

Light also behaves as particles with specific wavelengths — **photons**; that travel in straight lines within a medium

Spectral Power Distribution

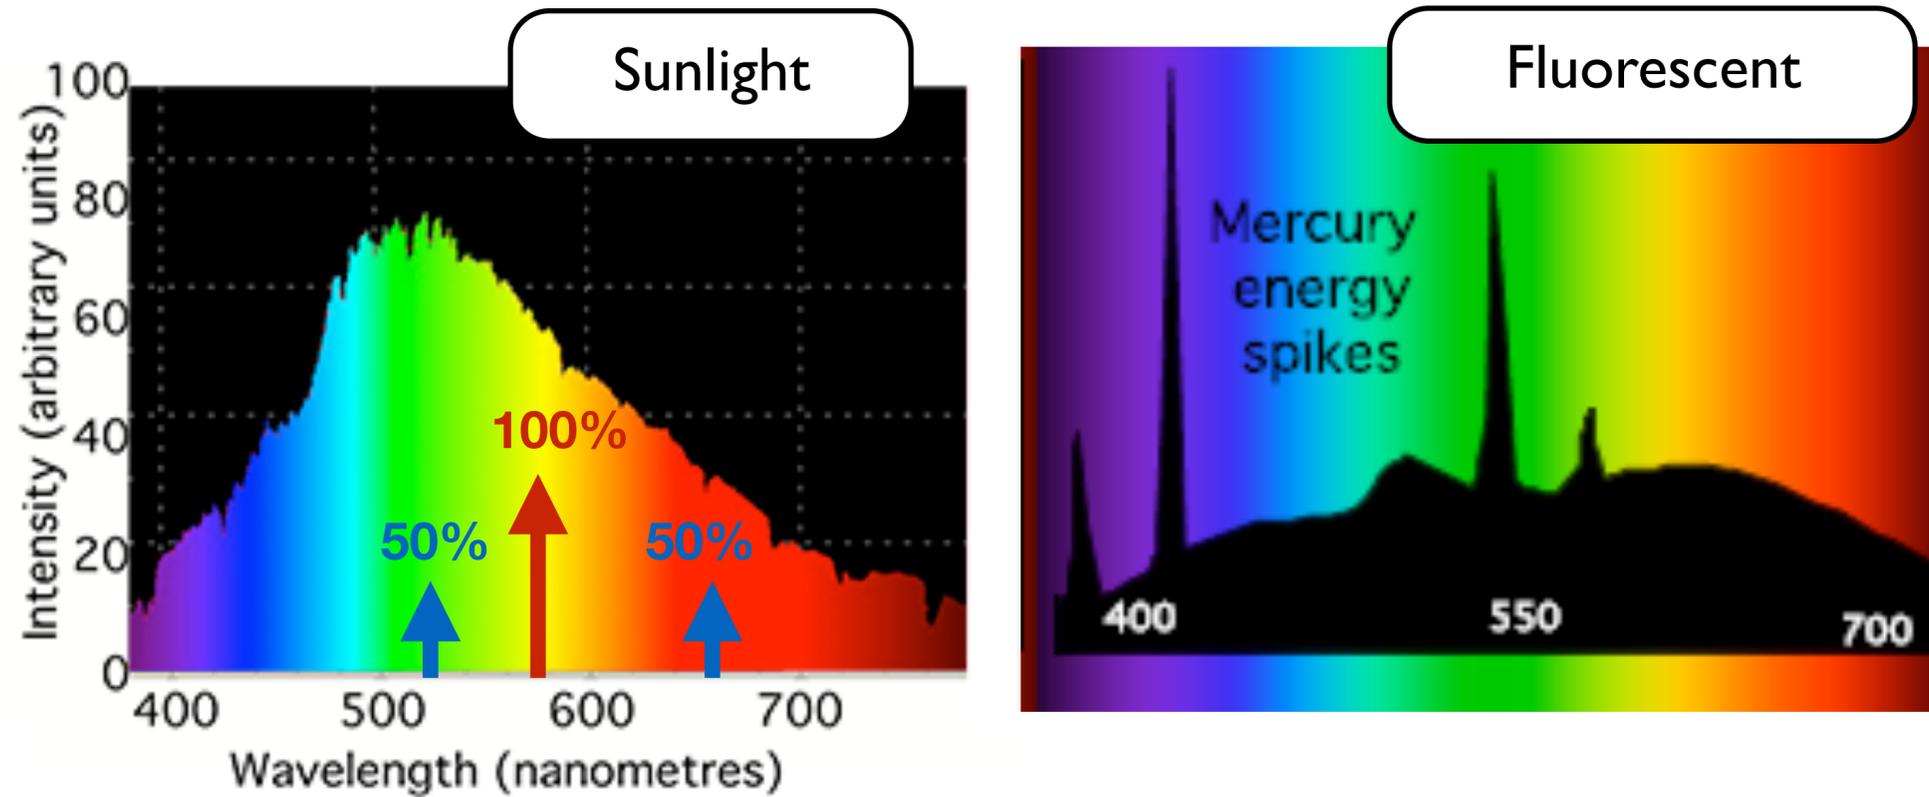

The **spectral distribution of energy** in a light ray determines its colour — e.g., you can have pure yellow or mixture of red and green

Surface **reflects** light energy according to a spectral distribution as well

The combination of **incident** and **reflectance** spectra determines **observed colour**

Spectral Power Distribution

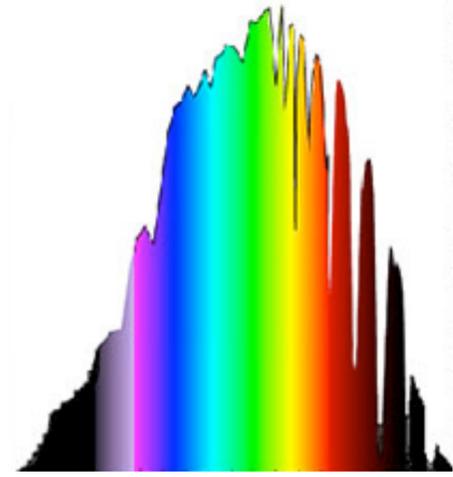

The **spectral distribution of energy** in a light ray determines its colour — e.g., you can have pure yellow or mixture of red and green

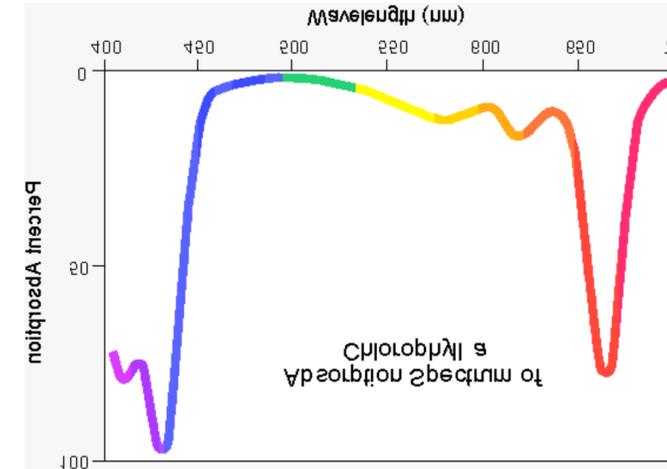

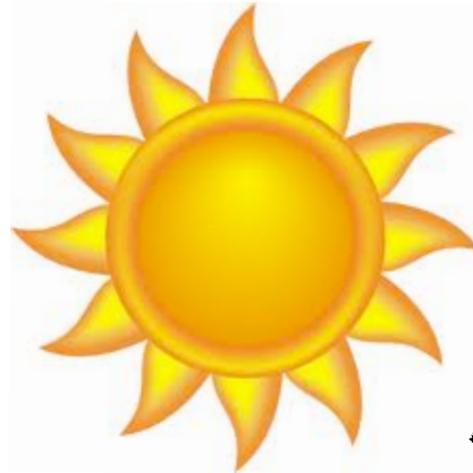

Surface **reflects** light energy according to a spectral distribution as well

The combination of **incident** and **reflectance** spectra determines **observed colour**

Spectral Reflectance Example

$$E(\lambda)$$

$$S(\lambda)$$

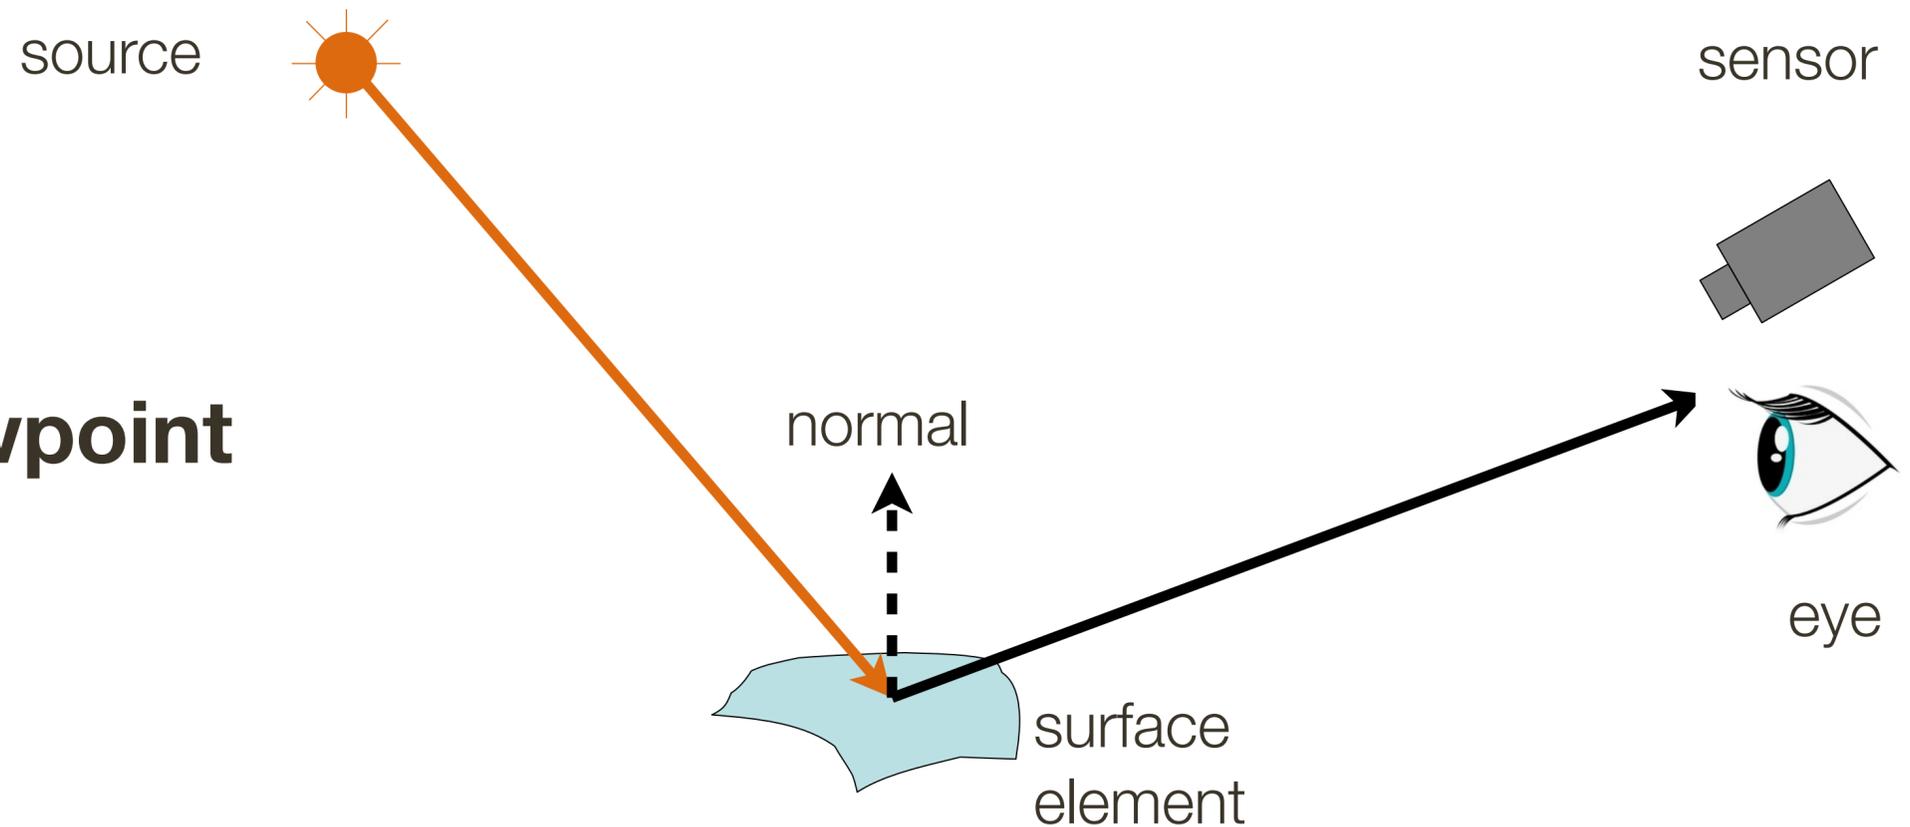

$$E(\lambda)S(\lambda)$$

Sensor (or eye) **captures amount of light** reflected from the object

(small) Graphics Review

(small) Graphics Review

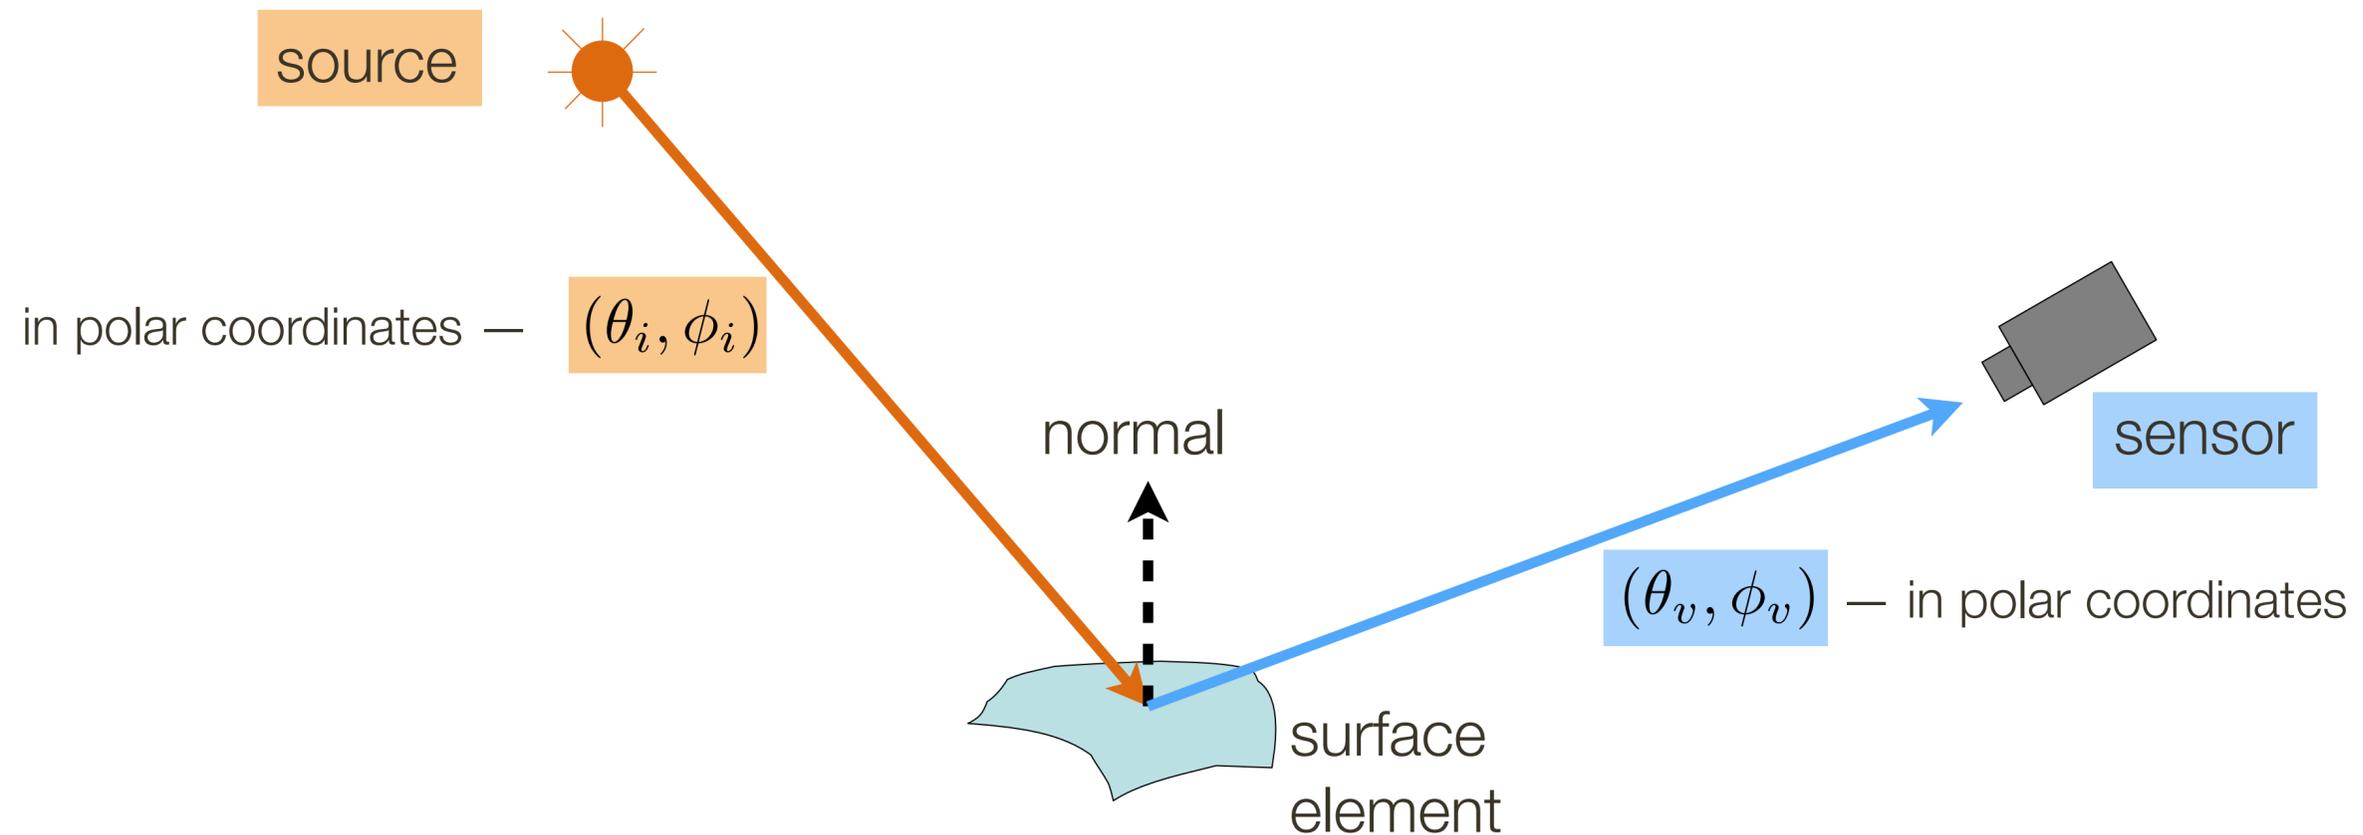

(small) Graphics Review

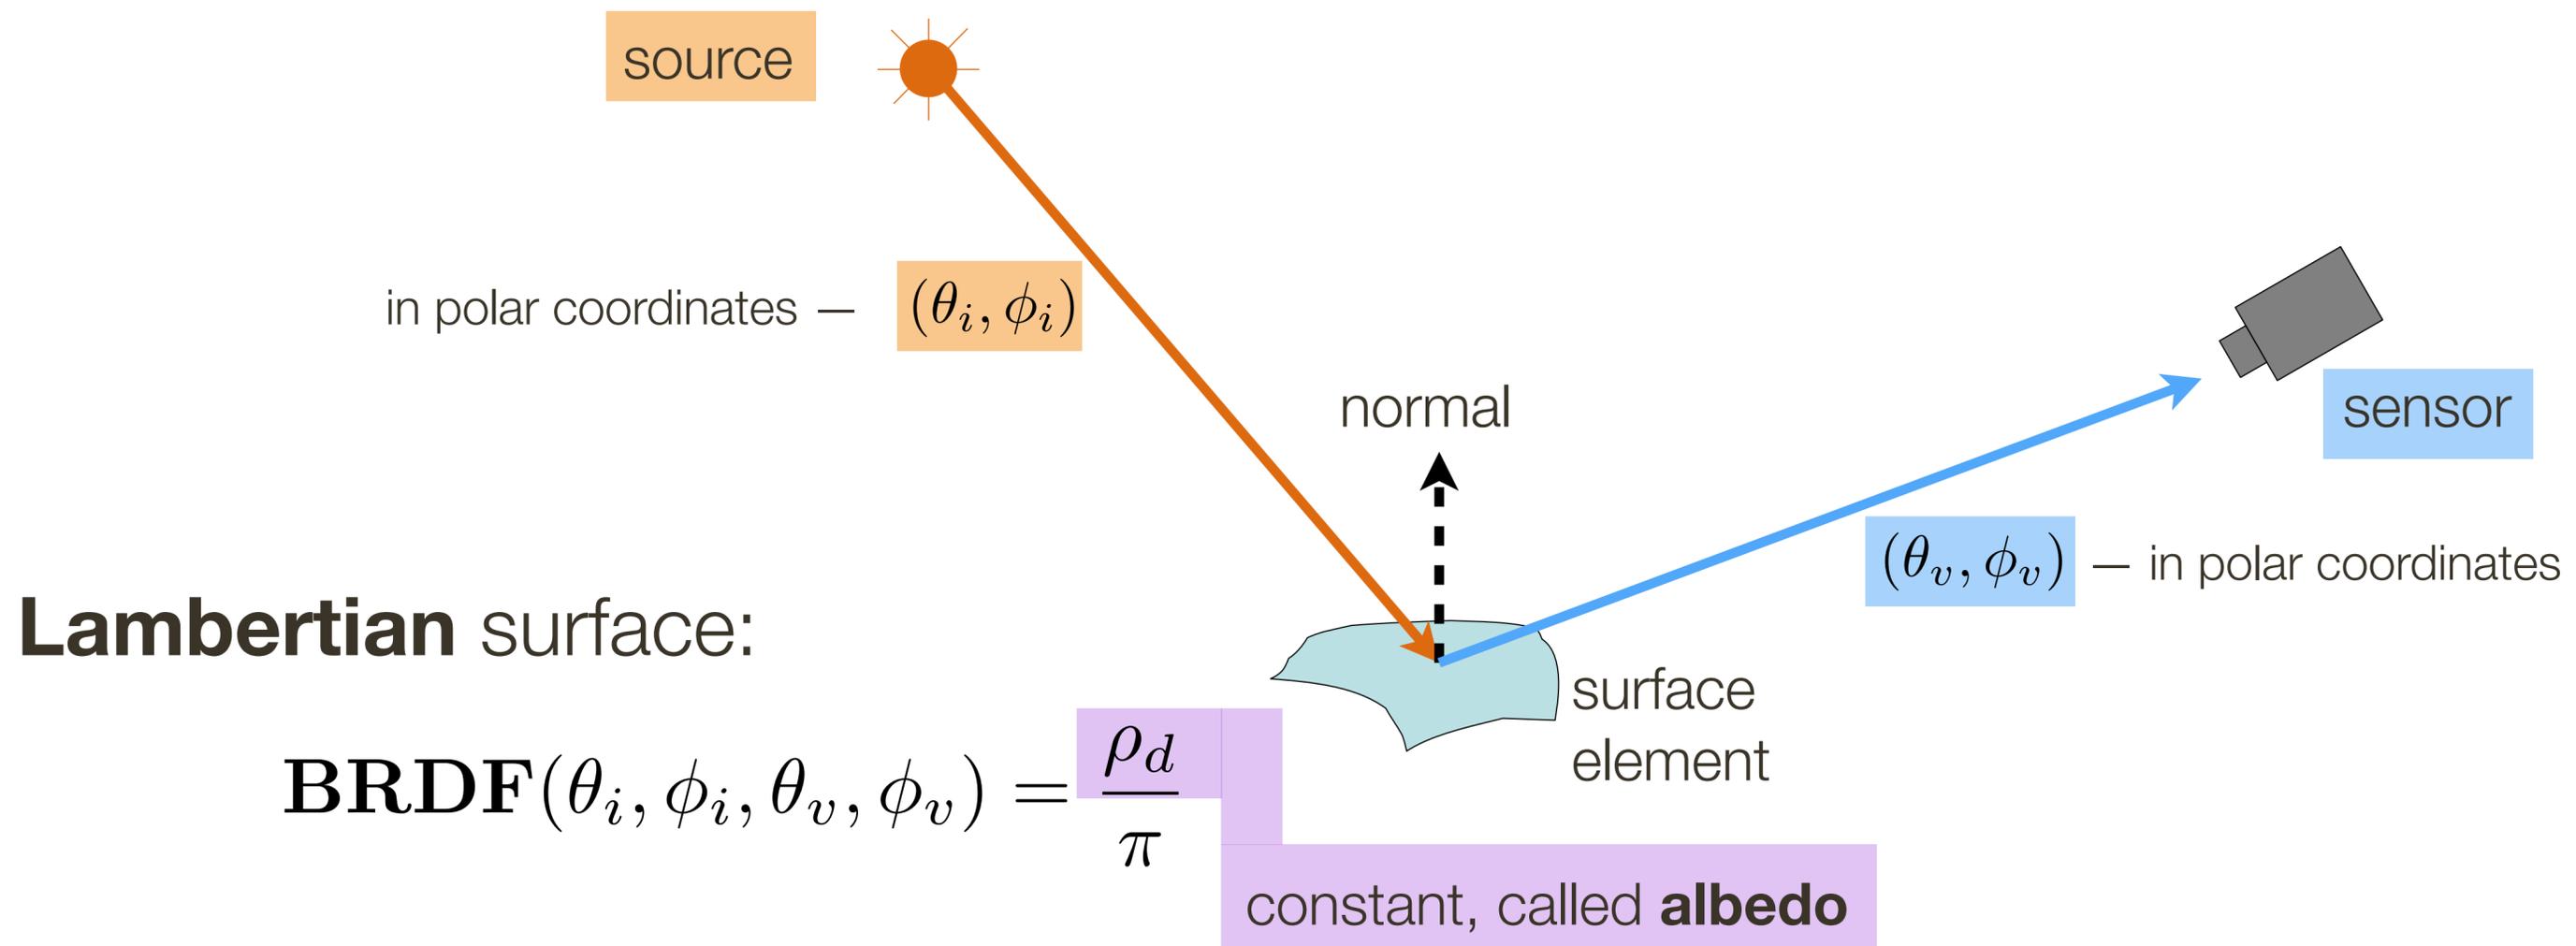

(small) Graphics Review

Surface reflection depends on both the **viewing** (θ_v, ϕ_v) and **illumination** (θ_i, ϕ_i) direction, with Bidirectional Reflection Distribution Function: **BRDF** $(\theta_i, \phi_i, \theta_v, \phi_v)$

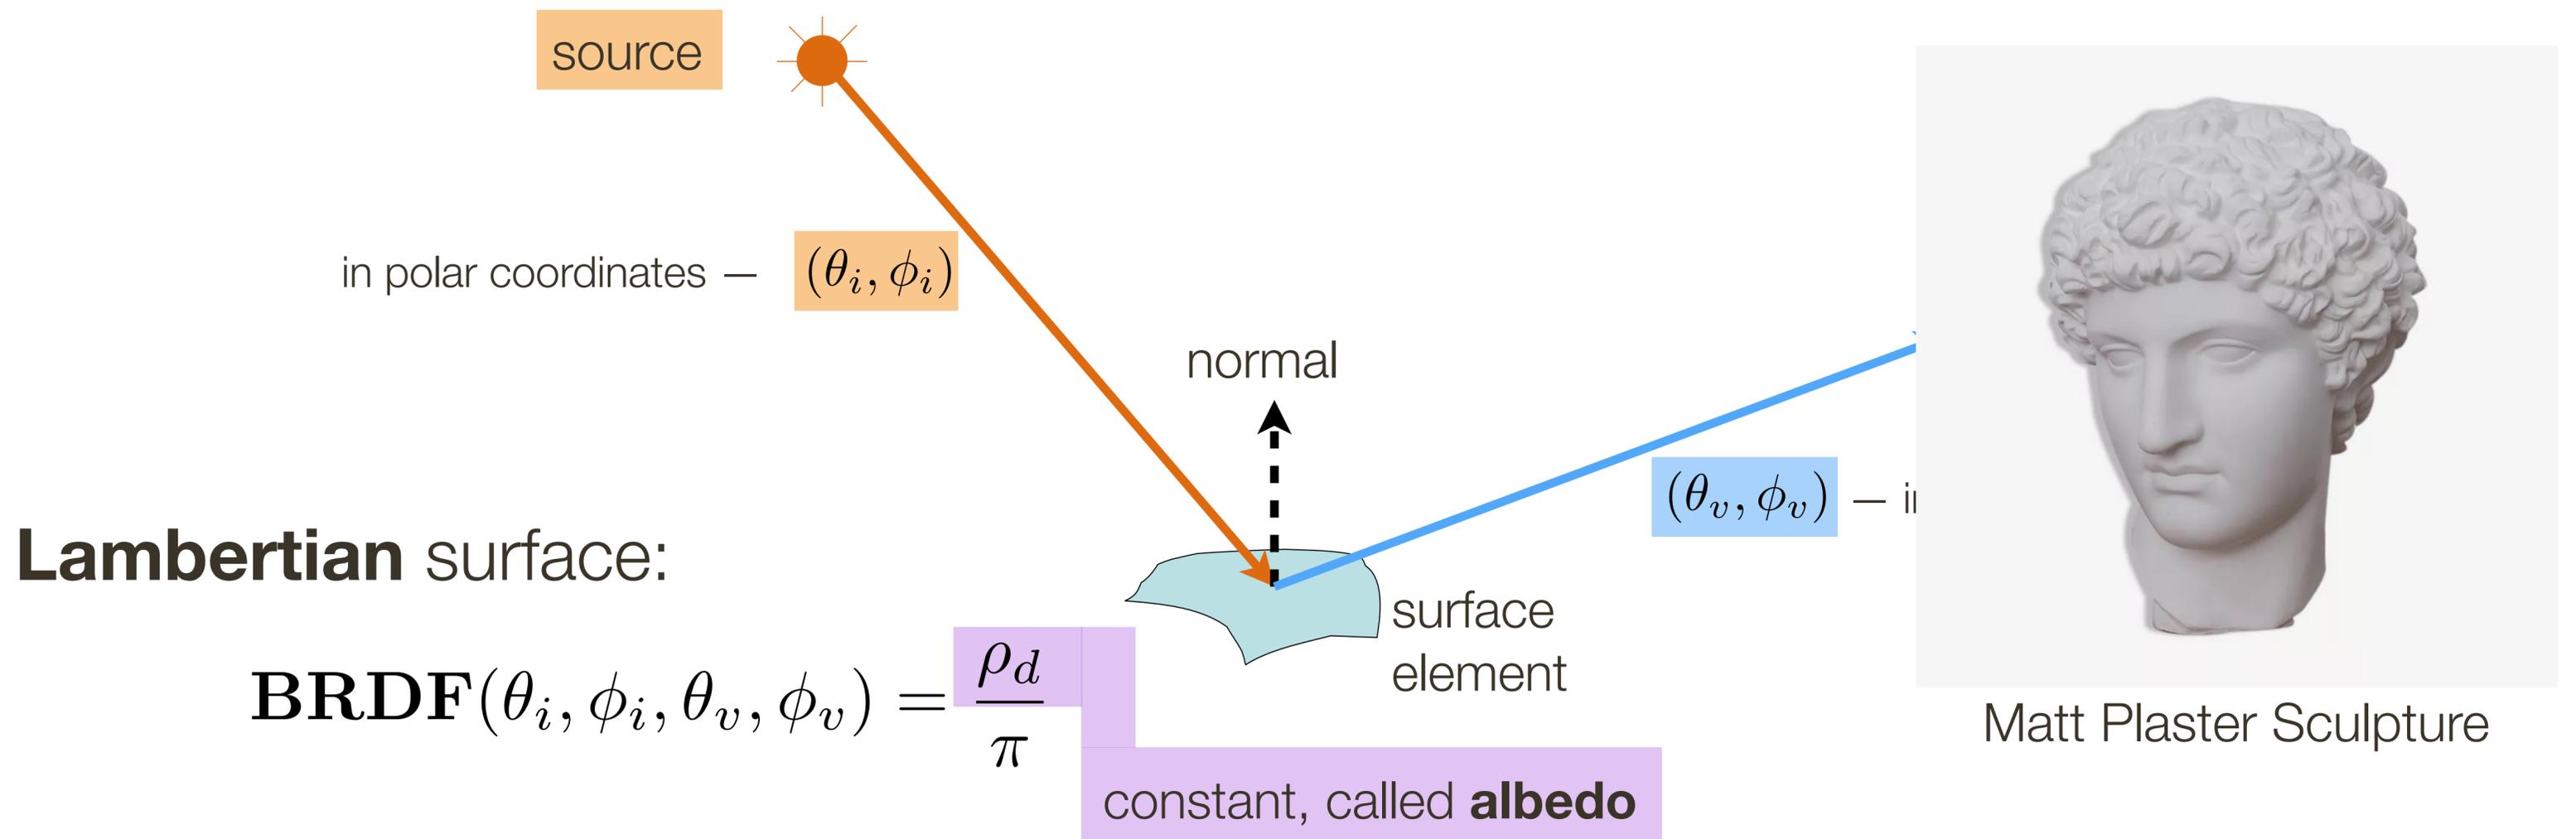

(small) Graphics Review

Surface reflection depends on both the **viewing** (θ_v, ϕ_v) and **illumination** (θ_i, ϕ_i) direction, with Bidirectional Reflection Distribution Function: **BRDF** $(\theta_i, \phi_i, \theta_v, \phi_v)$

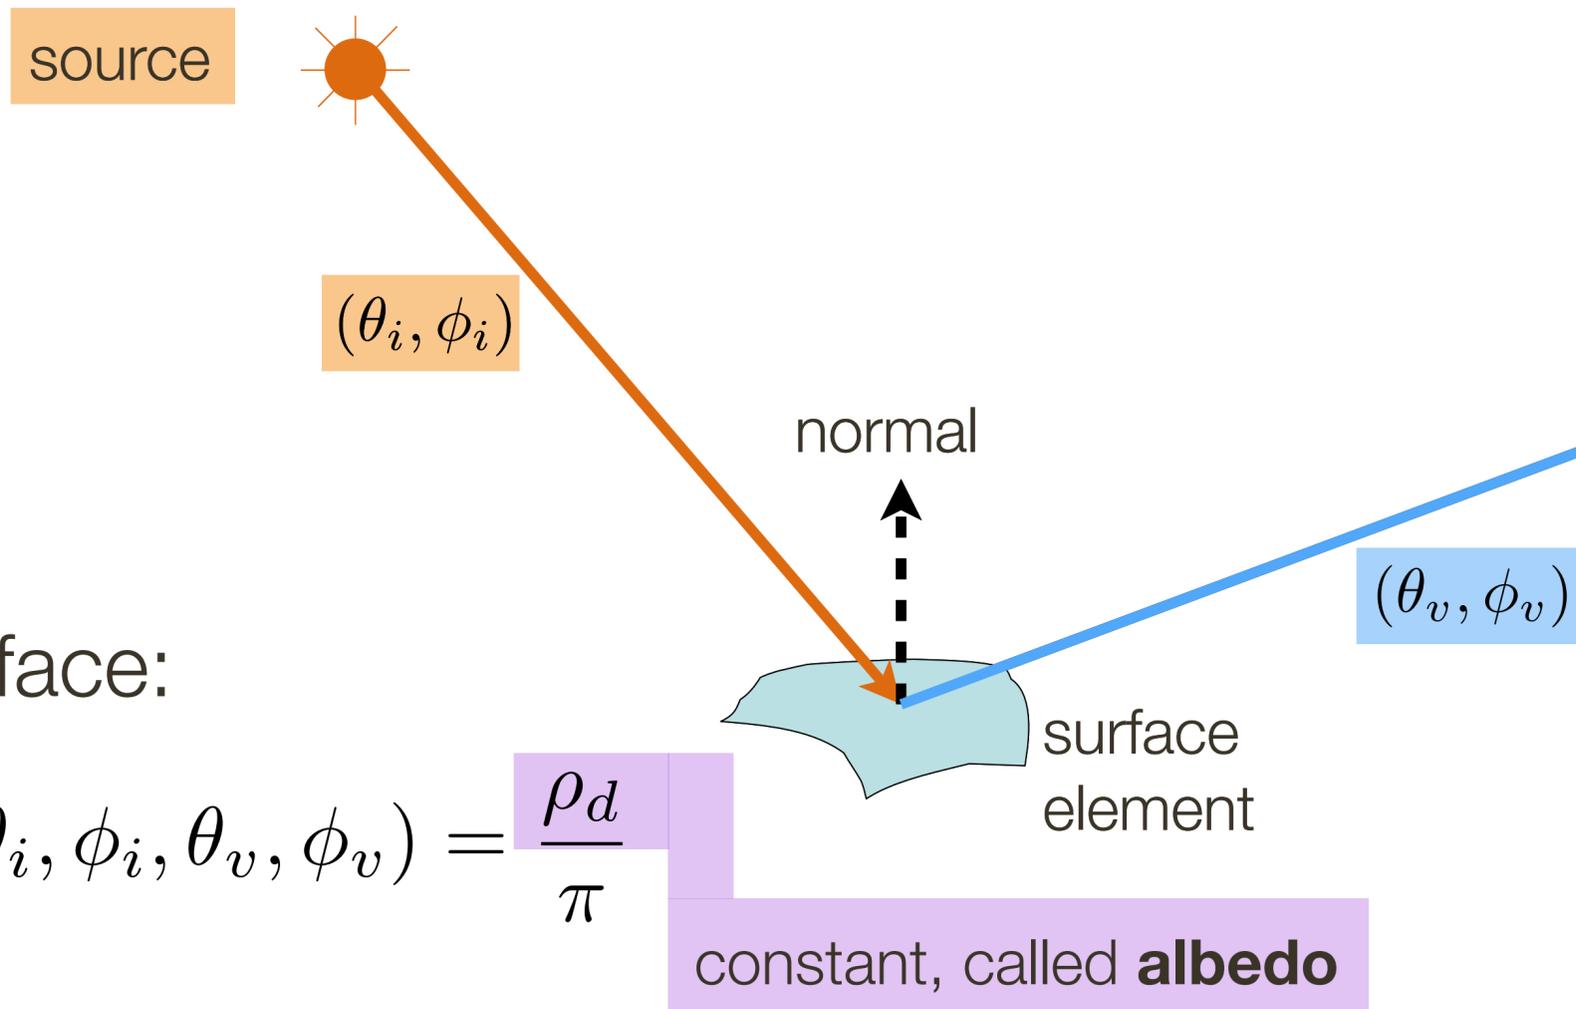

(small) Graphics Review

Surface reflection depends on both the **viewing** (θ_v, ϕ_v) and **illumination** (θ_i, ϕ_i) direction, with Bidirectional Reflection Distribution Function: **BRDF** $(\theta_i, \phi_i, \theta_v, \phi_v)$

(small) Graphics Review

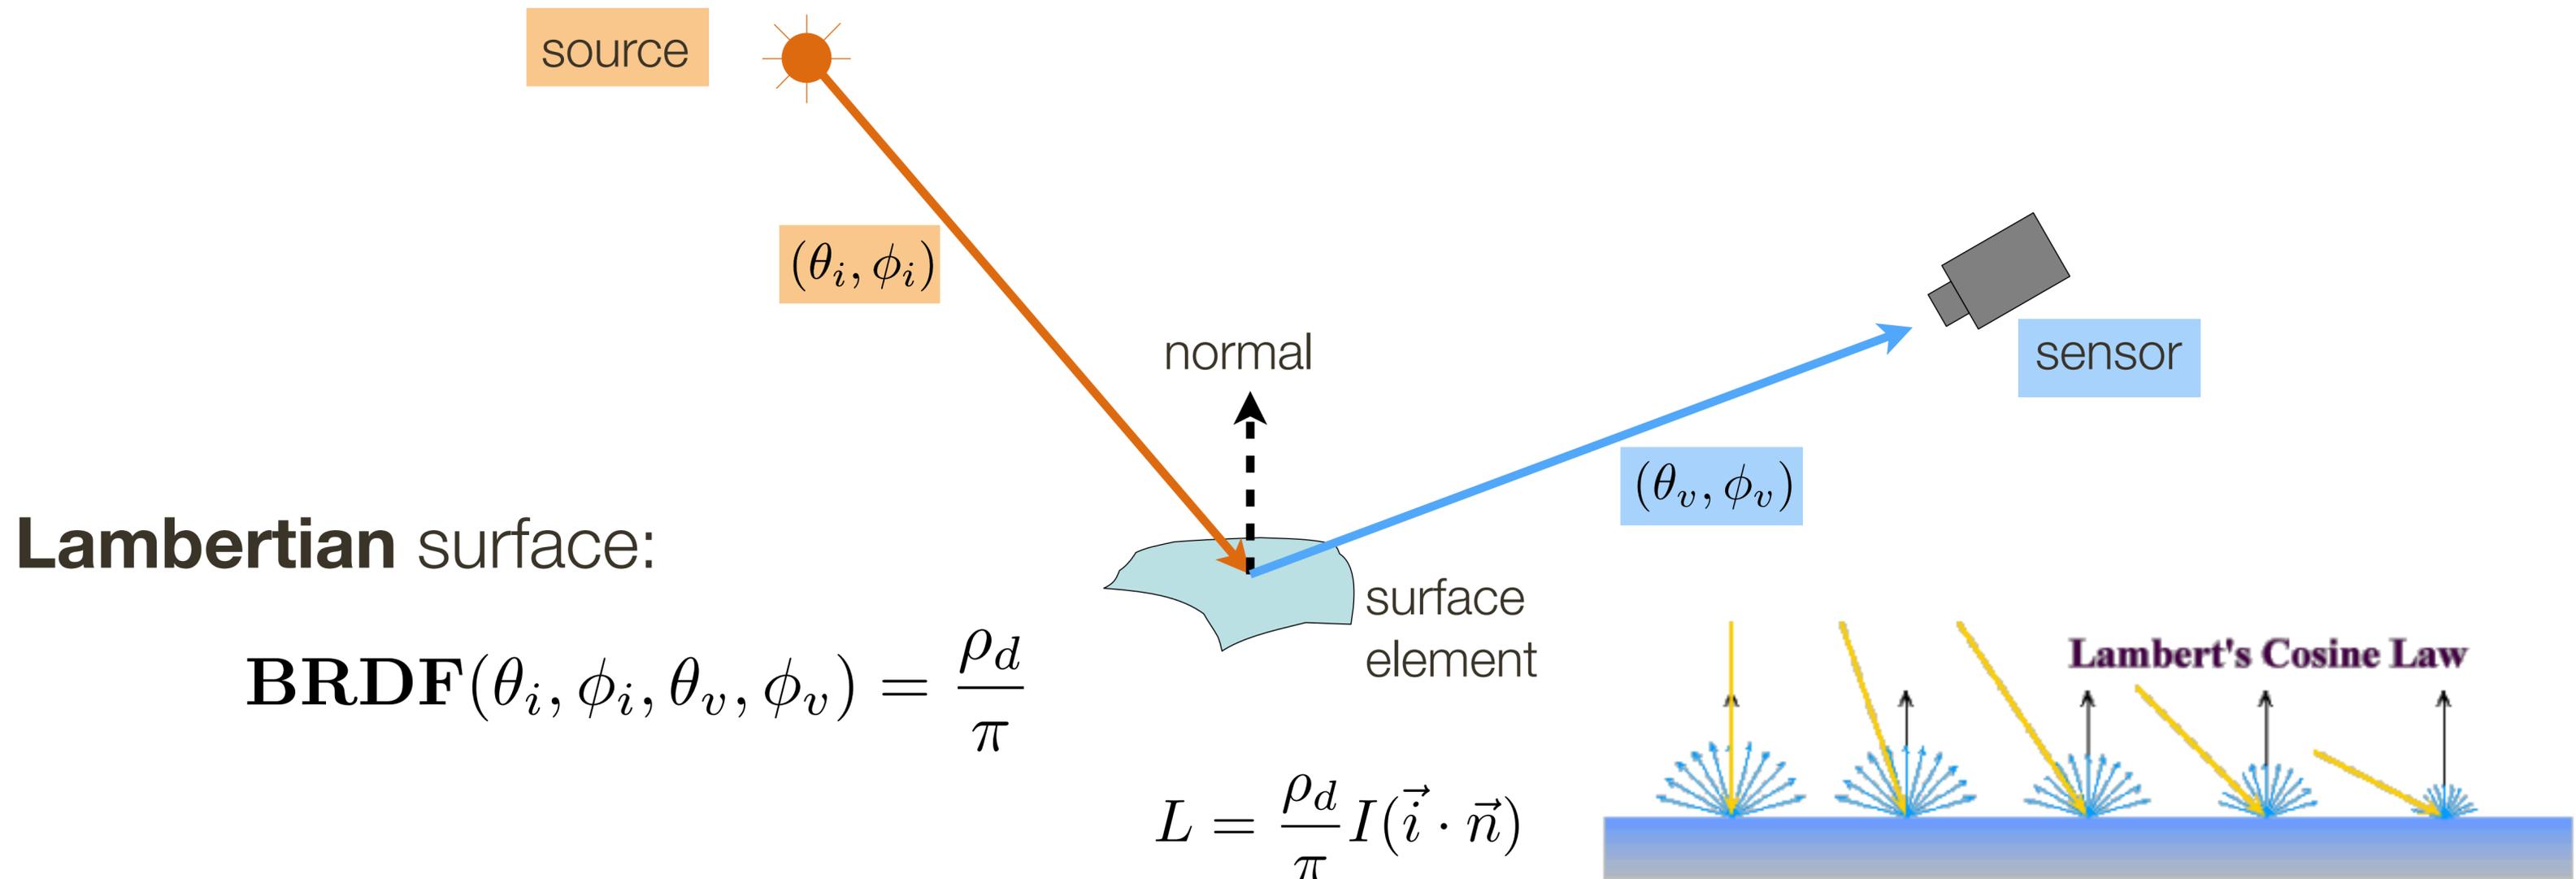

Surface reflection depends on both the **viewing** (θ_v, ϕ_v) and **illumination** (θ_i, ϕ_i) direction, with Bidirectional Reflection Distribution Function: **BRDF** $(\theta_i, \phi_i, \theta_v, \phi_v)$

Surface type	Typical value
Fresh asphalt	0.03 – 0.04
Open ocean	0.06
Conifer forest (summer)	0.08 – 0.15
Worn asphalt	0.12
Deciduous trees	0.15 – 0.18
Sand	0.15 – 0.45
Tundra	0.18 – 0.25
Agricultural crops	0.18 – 0.25
Bare soil	0.17
Green grass	0.20 – 0.25
Desert sand	0.30 – 0.40
Snow	0.40 – 0.90
Ocean ice	0.50 – 0.70
Fresh snow	0.80 – 0.90

(small) Graphics Review

Surface reflection depends on both the **viewing** (θ_v, ϕ_v) and **illumination** (θ_i, ϕ_i) direction, with Bidirectional Reflection Distribution Function: **BRDF** $(\theta_i, \phi_i, \theta_v, \phi_v)$

(small) Graphics Review

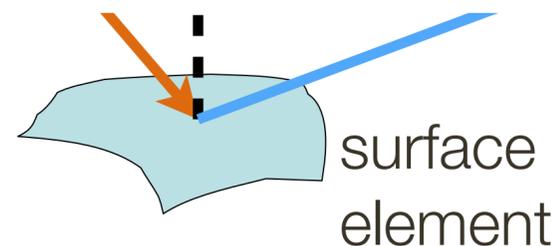

Surface reflection depends on both the **viewing** (θ_v, ϕ_v) and **illumination** (θ_i, ϕ_i) direction, with Bidirectional Reflection Distribution Function: **BRDF** $(\theta_i, \phi_i, \theta_v, \phi_v)$

To sum up: For a perfect **lambertian** surface reflected light is

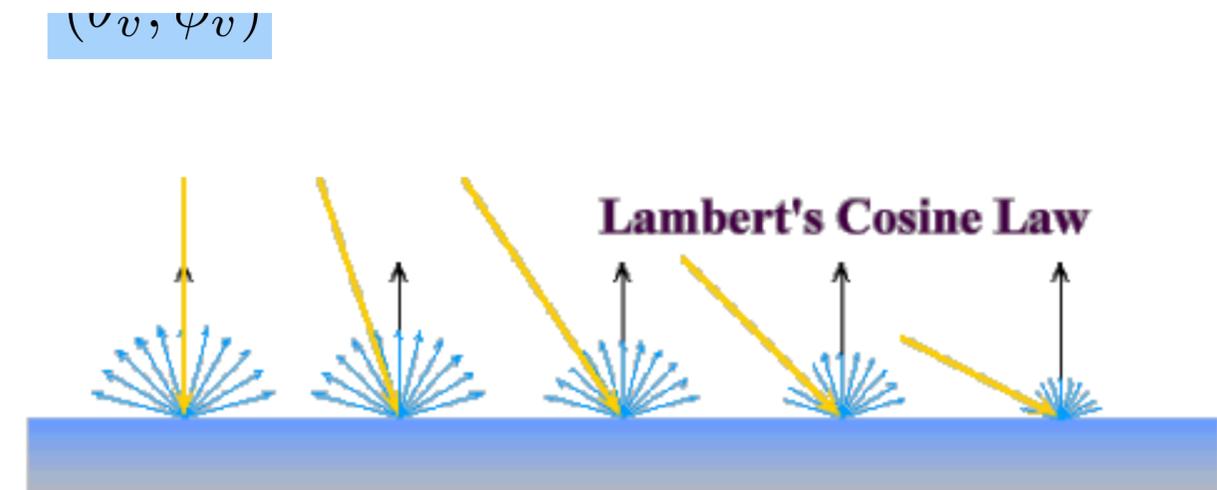

- (1) amount and color of incident light — I
- (2) fraction of light being reflected (material) — ρ_d
- (3) angle between the light and the surface (geometry) — $(\vec{i} \cdot \vec{n})$

Lambertian surface:

$$\text{BRDF}(\theta_i, \phi_i, \theta_v, \phi_v) = \frac{\rho_d}{\pi}$$

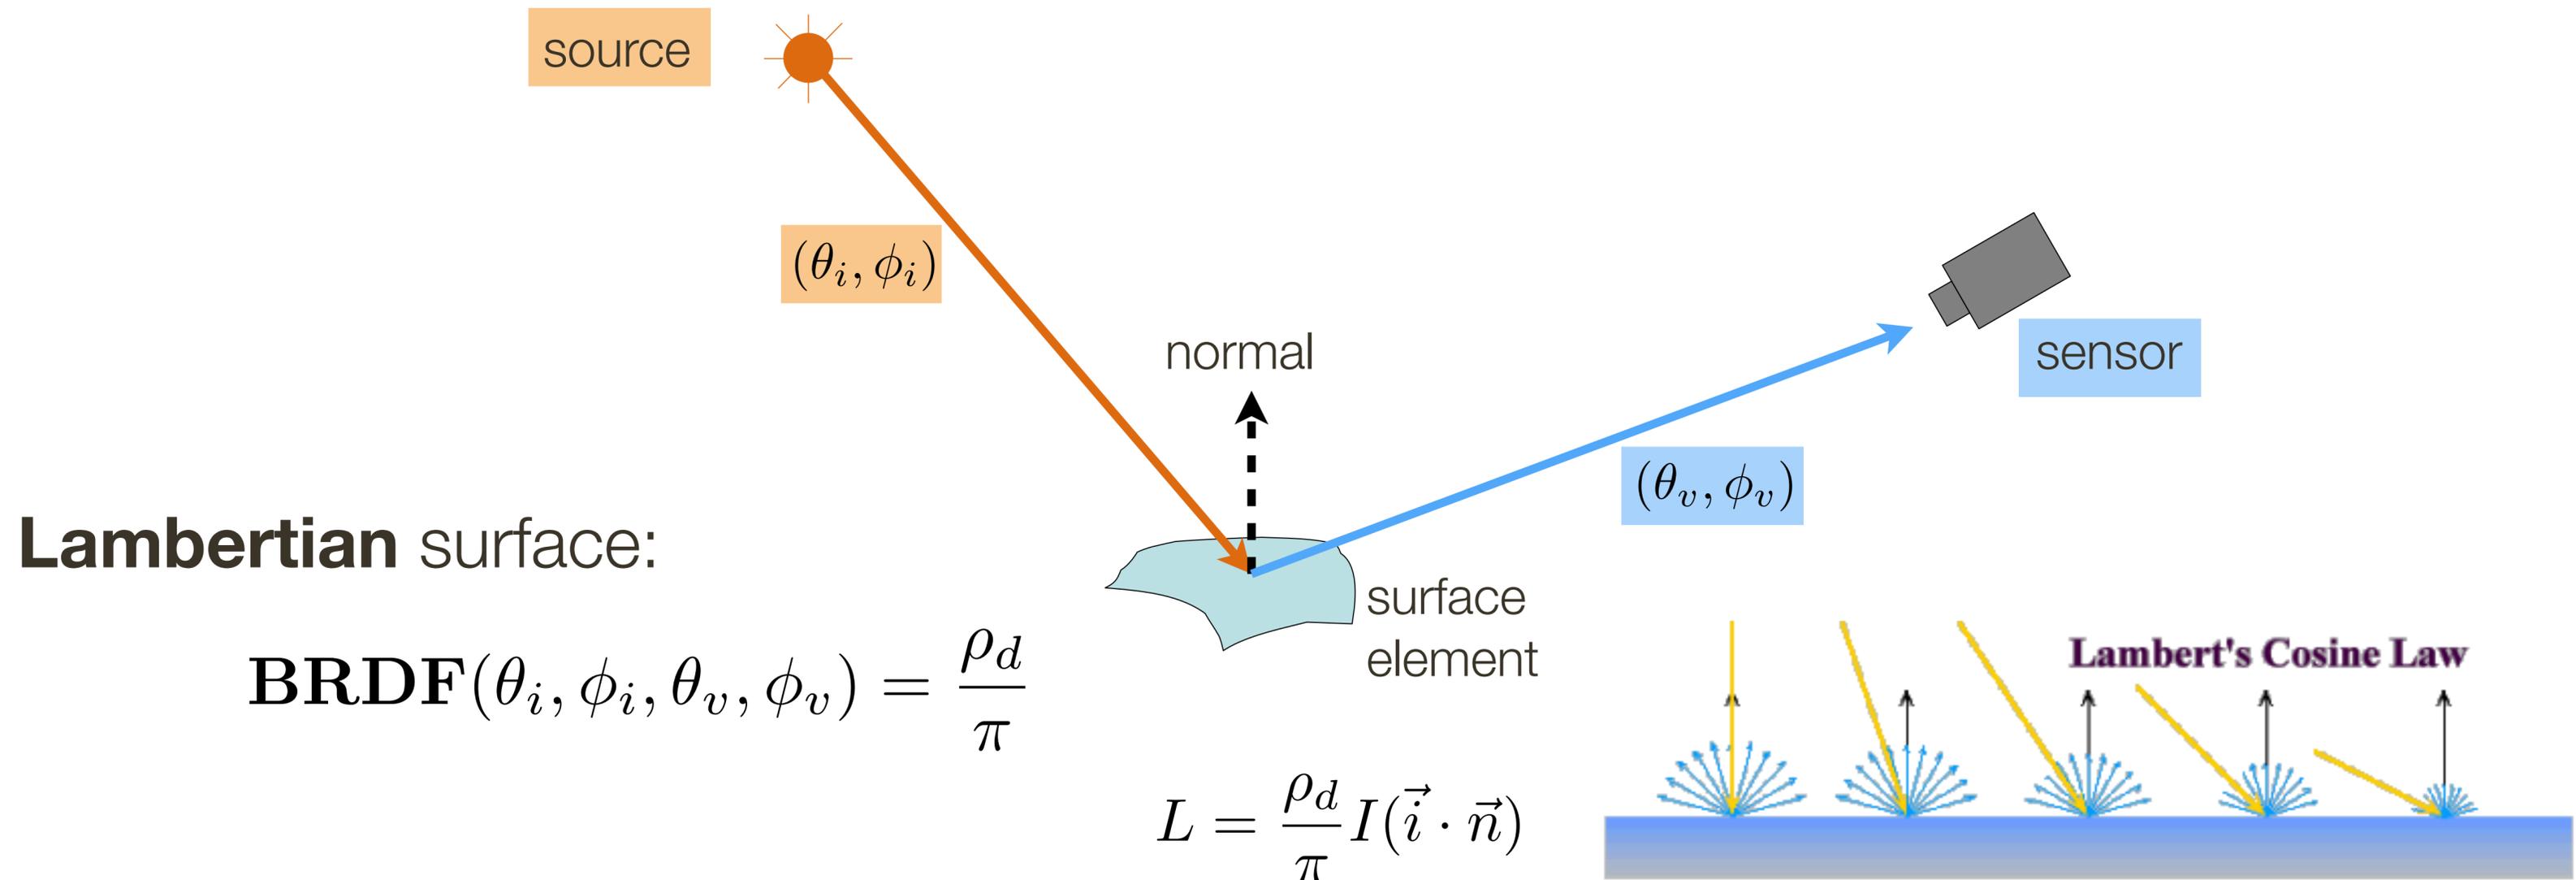

$$L = \frac{\rho_d}{\pi} I(\vec{i} \cdot \vec{n})$$

(small) Graphics Review

Question: What are the simplifying assumptions we are making here?

(small) Graphics Review

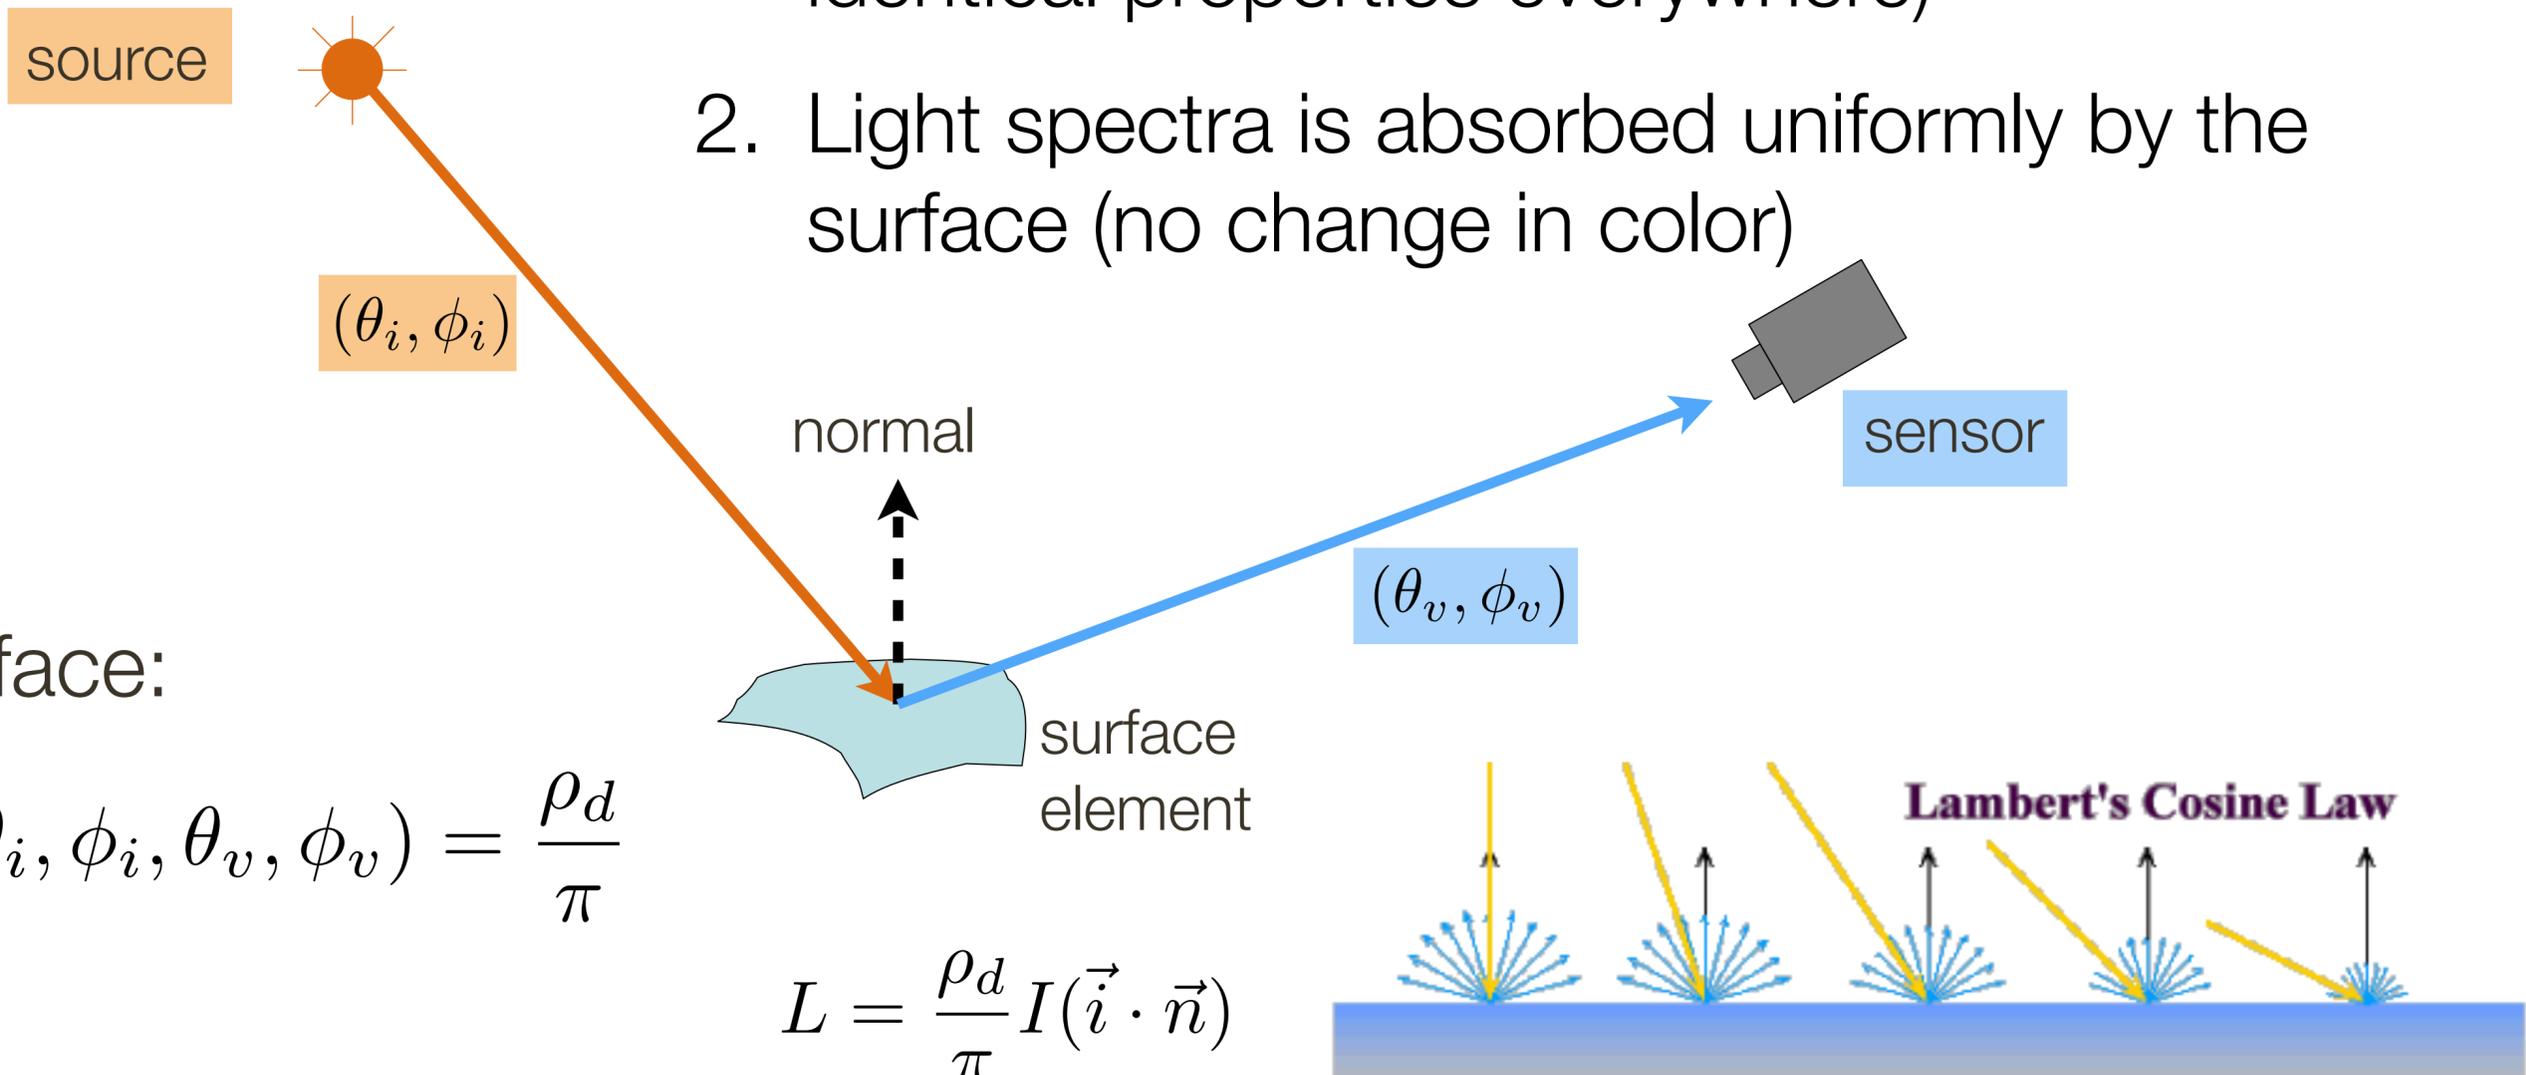

Question: What are the simplifying assumptions we are making here?

1. BRDF is the same everywhere (i.e., surface has identical properties everywhere)
2. Light spectra is absorbed uniformly by the surface (no change in color)

Lambertian surface:

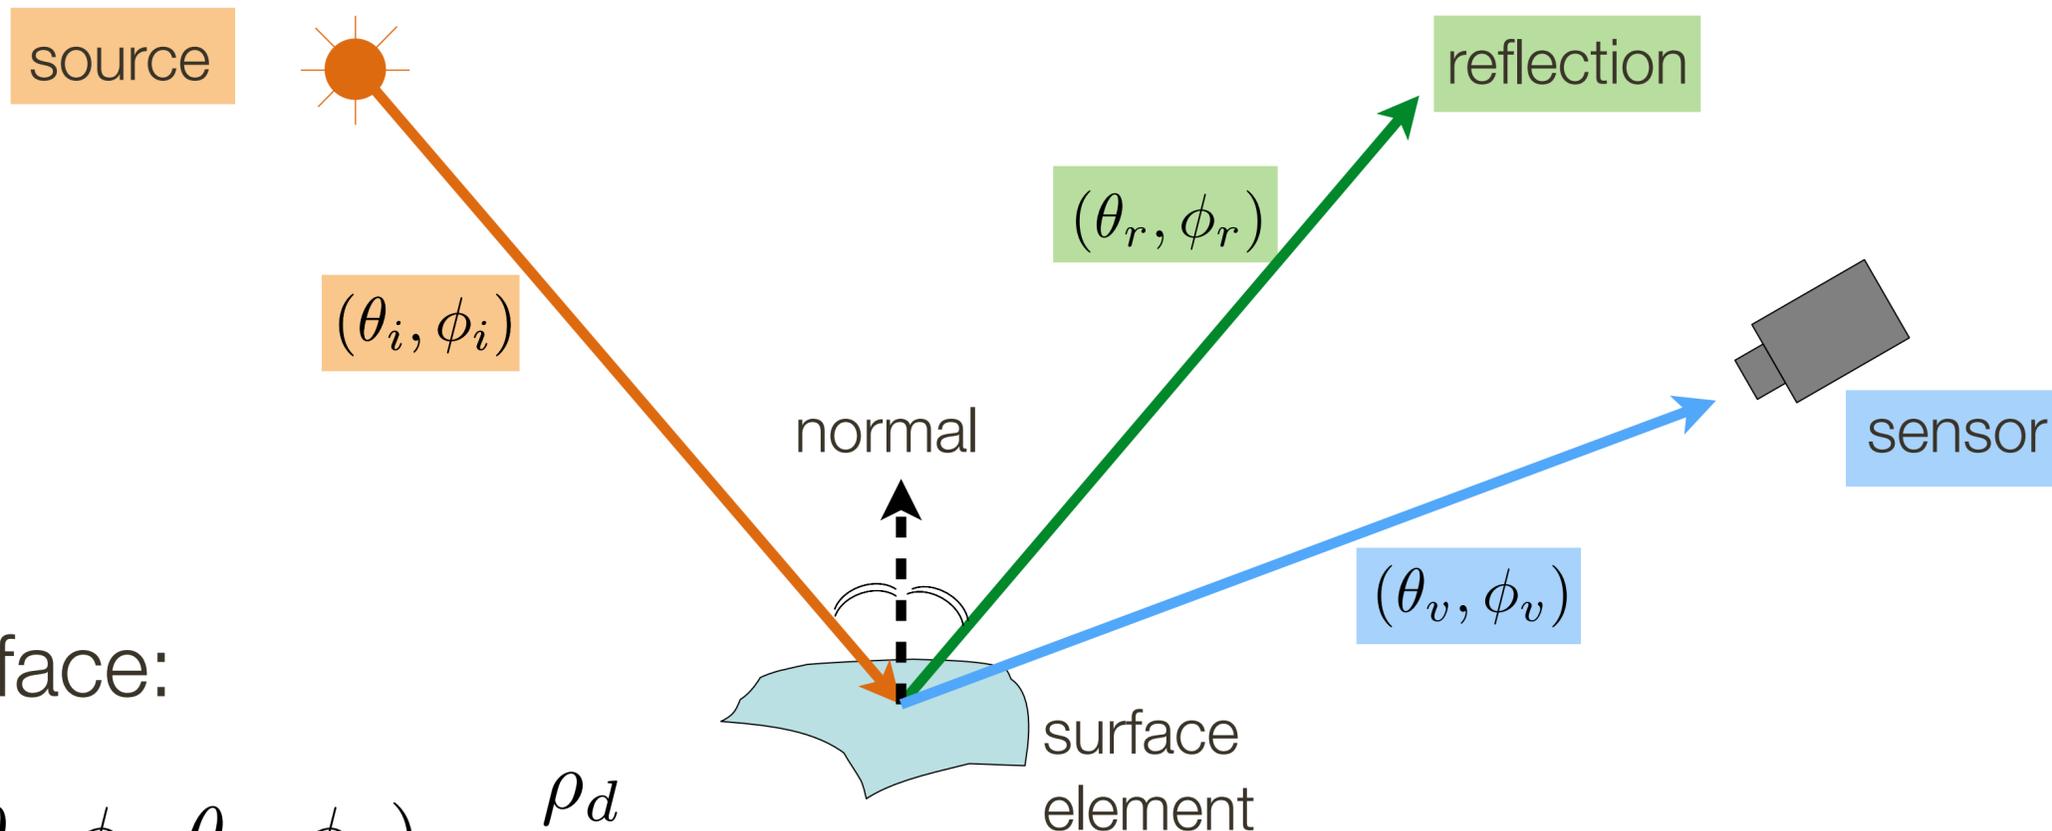

$$\text{BRDF}(\theta_i, \phi_i, \theta_v, \phi_v) = \frac{\rho_d}{\pi}$$

$$L = \frac{\rho_d}{\pi} I(\vec{i} \cdot \vec{n})$$

(small) Graphics Review

Surface reflection depends on both the **viewing** (θ_v, ϕ_v) and **illumination** (θ_i, ϕ_i) direction, with Bidirectional Reflection Distribution Function: **BRDF** $(\theta_i, \phi_i, \theta_v, \phi_v)$

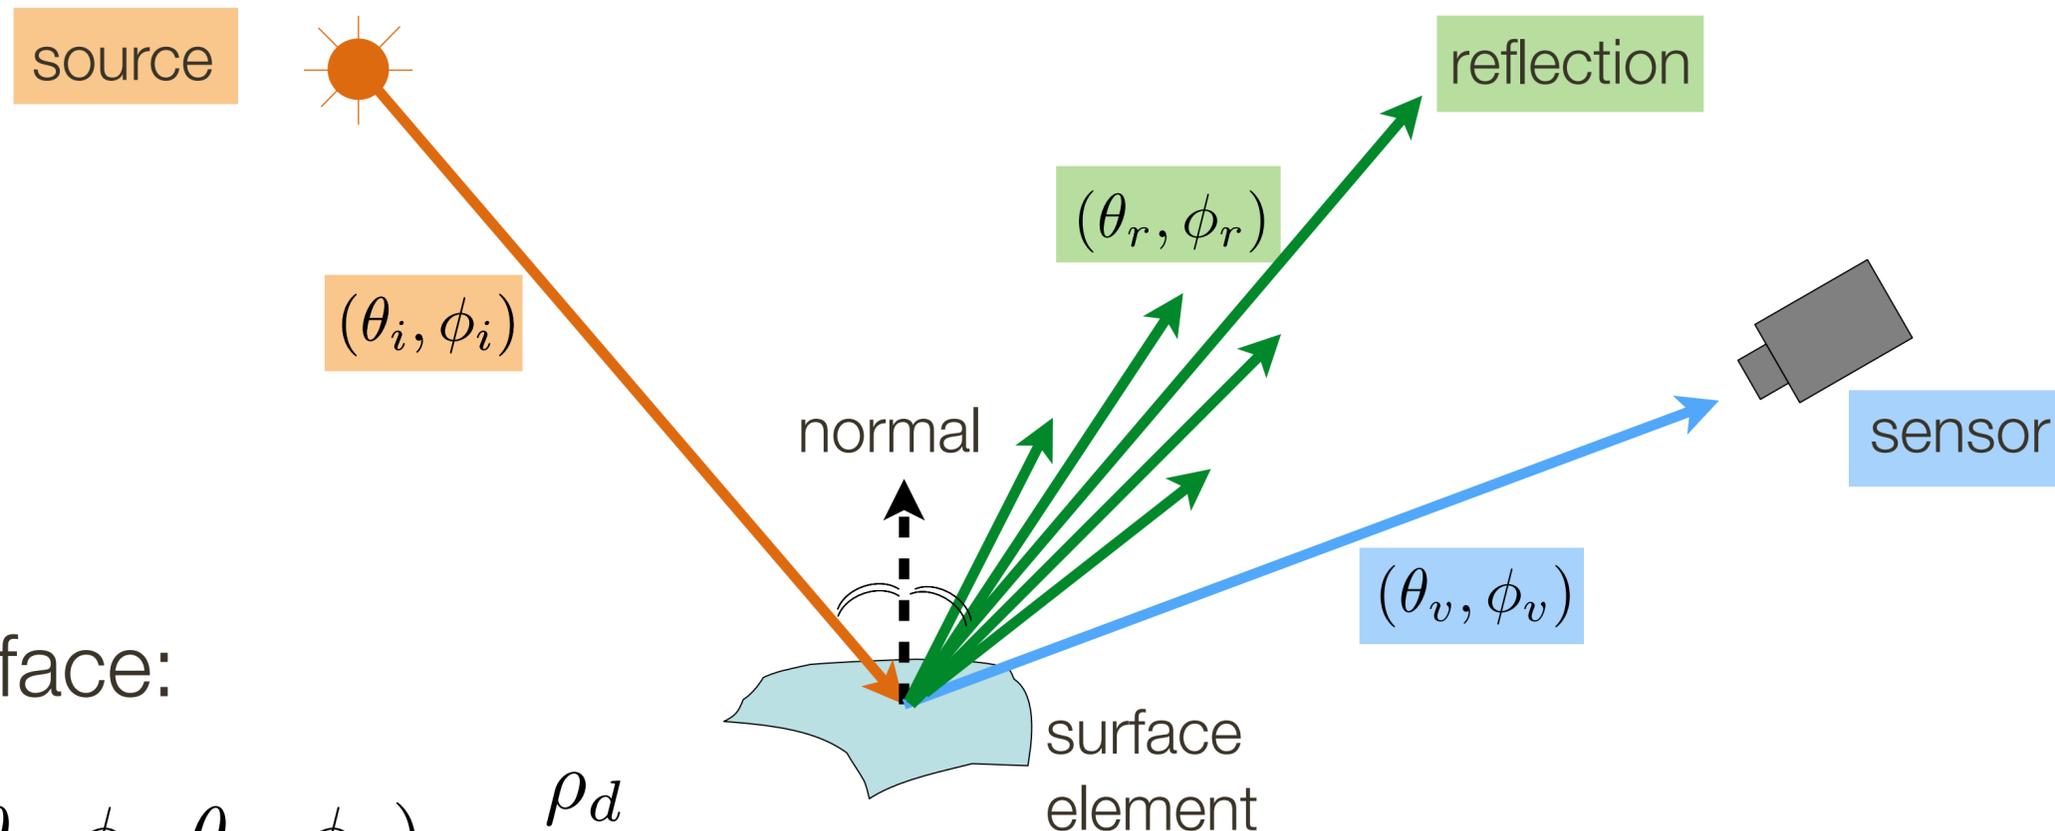

Lambertian surface:

$$\mathbf{BRDF}(\theta_i, \phi_i, \theta_v, \phi_v) = \frac{\rho_d}{\pi}$$
$$L = \frac{\rho_d}{\pi} I(\vec{i} \cdot \vec{n})$$

Mirror surface: all incident light reflected in one directions $(\theta_v, \phi_v) = (\theta_r, \phi_r)$

(small) Graphics Review

Surface reflection depends on both the **viewing** (θ_v, ϕ_v) and **illumination** (θ_i, ϕ_i) direction, with Bidirectional Reflection Distribution Function: **BRDF** $(\theta_i, \phi_i, \theta_v, \phi_v)$

Lambertian surface:

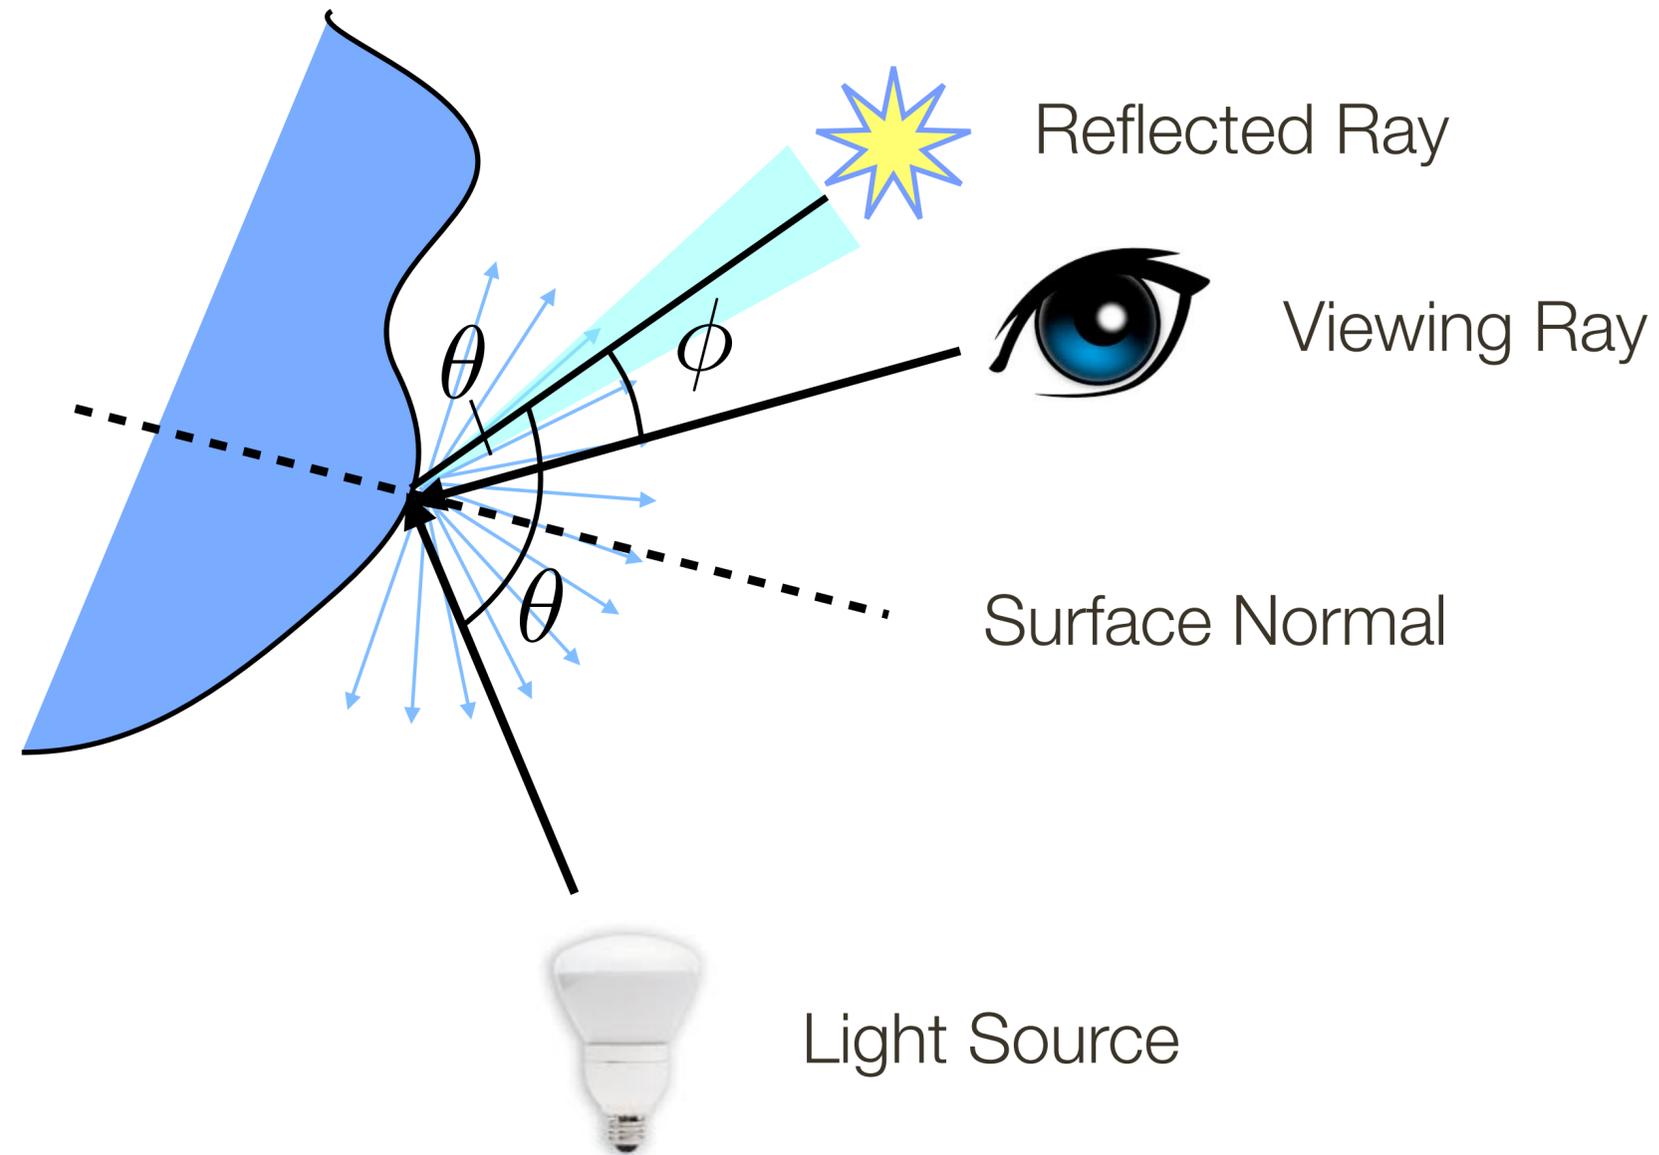

$$\mathbf{BRDF}(\theta_i, \phi_i, \theta_v, \phi_v) = \frac{\rho_d}{\pi}$$
$$L = \frac{\rho_d}{\pi} I(\vec{i} \cdot \vec{n})$$

Mirror surface: all incident light reflected in one directions $(\theta_v, \phi_v) = (\theta_r, \phi_r)$

Phong Illumination Model

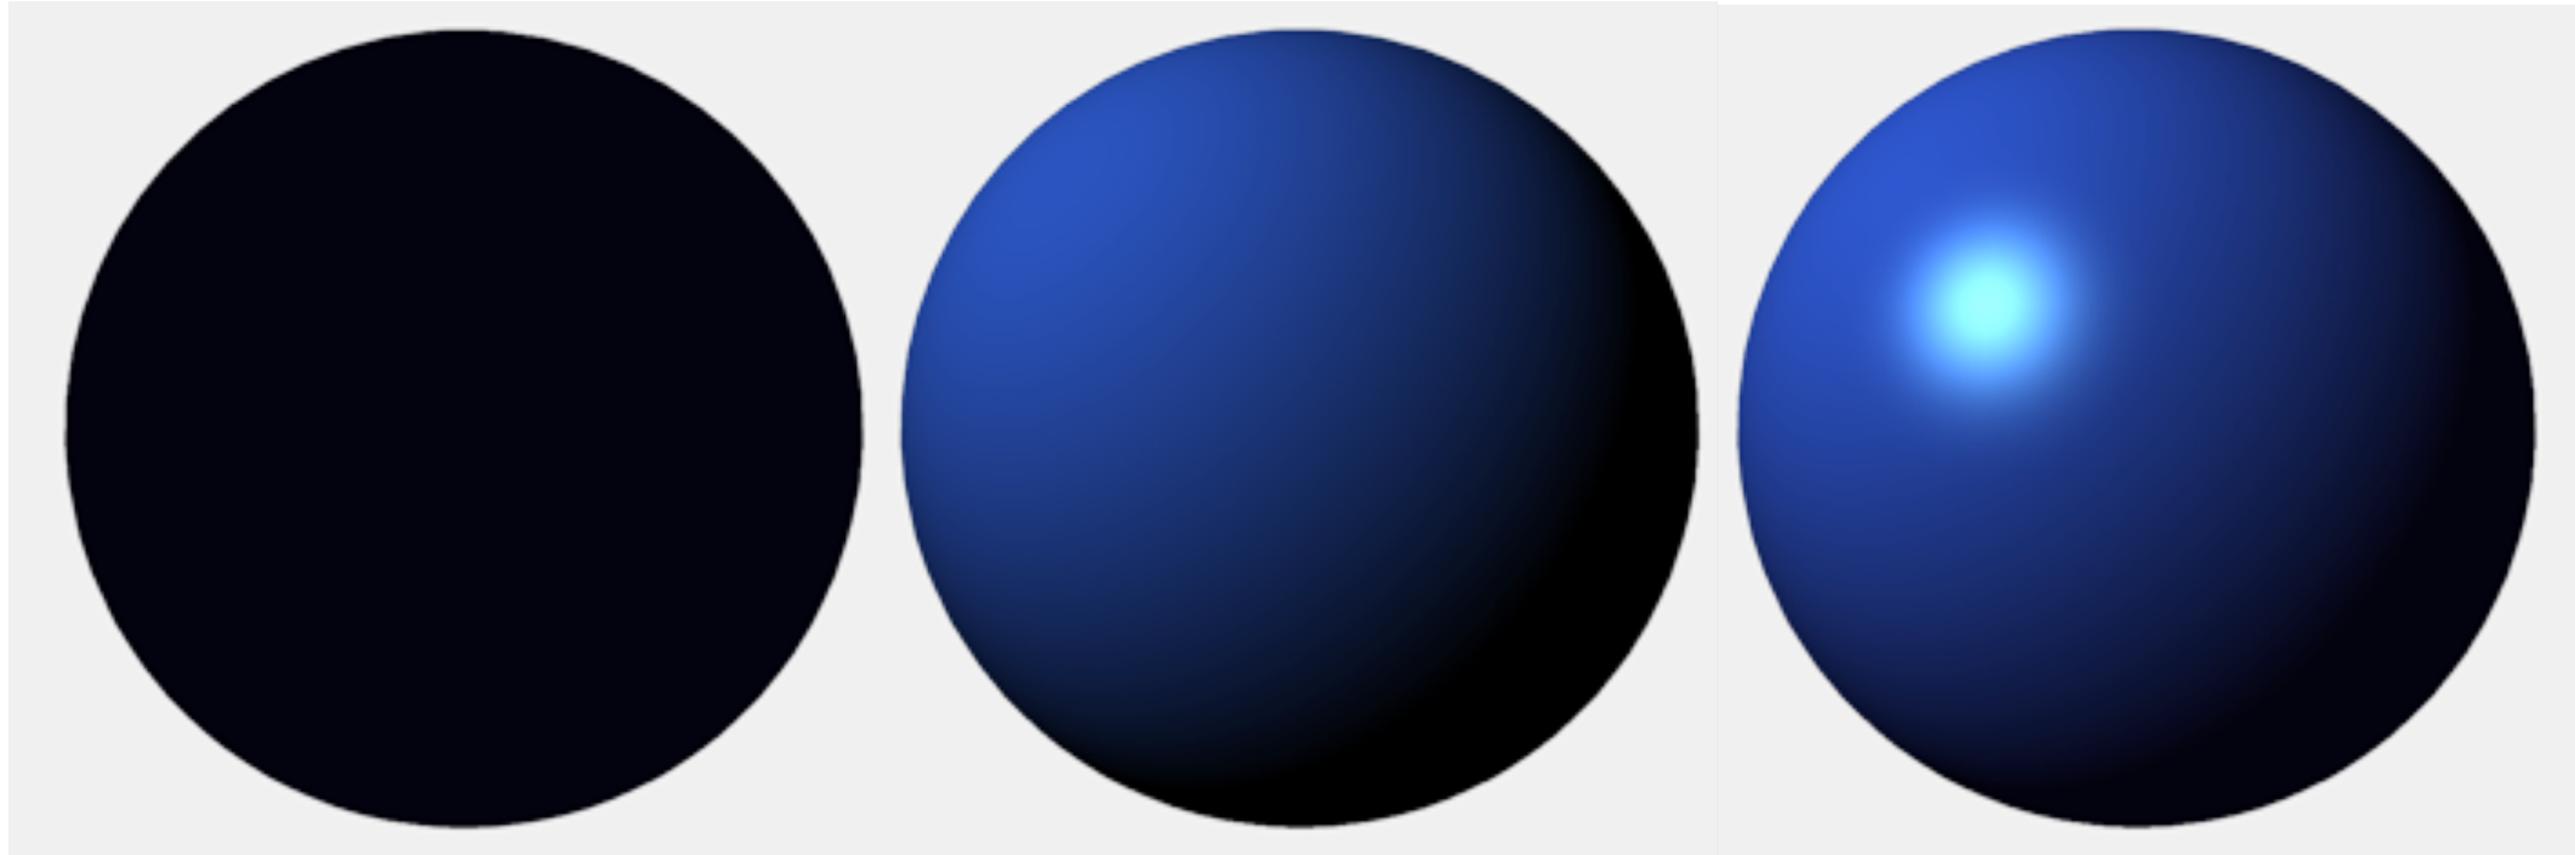

Includes **ambient**, **diffuse** and **specular** reflection

$$I = k_a i_a + k_d i_d \cos \theta + k_s i_s \cos^\alpha \phi$$

Camera Obscura (latin for “dark chamber”)

Reinerus Gemma-Frisius observed an eclipse of the sun at Louvain on January 24, 1544. He used this illustration in his book, “De Radio Astronomica et Geometrica,” 1545. It is thought to be the first published illustration of a camera obscura.

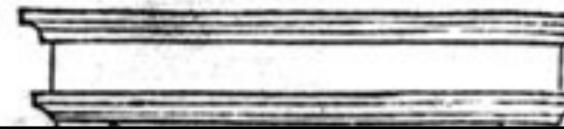

Credit: John H., Hammond, “Th Camera Obscure, A Chronicle”

Camera Obscura (latin for “dark chamber”)

illum in tabula per radios Solis, quam in cælo contin-
git: hoc est, si in cælo superior pars deliquiū patiat, in
radiis apparebit inferior deficere, vt ratio exigit optica.

*Solis deliquium Anno Christi
1544. Die 24. Januarij
Louanij*

principles behind the pinhole camera or camera obscura were first mentioned by Chinese philosopher Mozi (Mo-Ti) (470 to 390 BCE)

Sic nos exactè Anno .1544. Louanii eclipsim Solis
obseruauimus, inuenimusq; deficere paulò plus q̄ dex-

Reinerus Gemma-Frisius observed an eclipse of the sun at Louvain on January 24, 1544. He used this illustration in his book, “De Radio Astronomica et Geometrica,” 1545. It is thought to be the first published illustration of a camera obscura.

Perspective Aside

Perspective Aside

Properties of Projection

- **Points** project to **points**
- **Lines** project to **lines**
- **Planes** project to the **whole** or **half** image
- Angles are **not** preserved

Properties of Projection

- **Points** project to **points**
- **Lines** project to **lines**
- **Planes** project to the **whole** or **half** image
- Angles are **not** preserved

Degenerate cases

- Line through focal point projects to a point
- Plane through focal point projects to a line

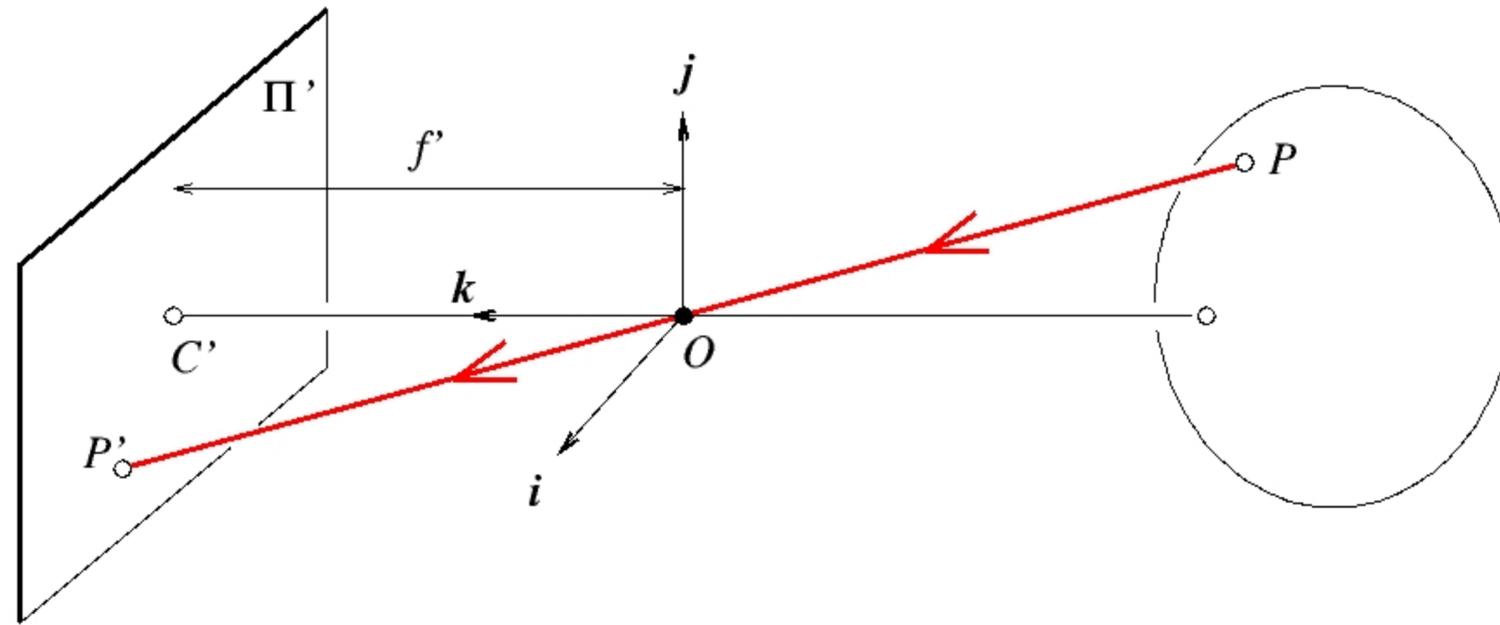

Projection Illusion

Projection Illusion

Perspective Projection

3D object point

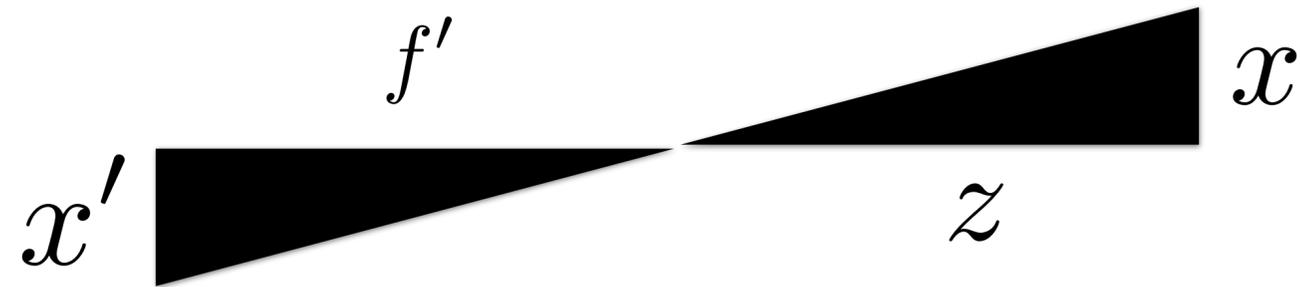

Forsyth & Ponce (1st ed.) Figure 1.4

$P = \begin{bmatrix} x \\ y \\ z \end{bmatrix}$ projects to 2D image point $P' = \begin{bmatrix} x' \\ y' \end{bmatrix}$ where

$$\begin{aligned} x' &= f' \frac{x}{z} \\ y' &= f' \frac{y}{z} \end{aligned}$$

Note: this assumes world coordinate frame at the optical center (pinhole) and aligned with the image plane, image coordinate frame aligned with the camera coordinate frame

Perspective Projection: Proof

3D object point

Forsyth & Ponce (1st ed.) Figure 1.4

$P = \begin{bmatrix} x \\ y \\ z \end{bmatrix}$ projects to 2D image point $P' = \begin{bmatrix} x' \\ y' \end{bmatrix}$ where

$$\begin{aligned} x' &= f' \frac{x}{z} \\ y' &= f' \frac{y}{z} \end{aligned}$$

Note: this assumes world coordinate frame at the optical center (pinhole) and aligned with the image plane, image coordinate frame aligned with the camera coordinate frame

Aside: Camera Matrix

Homogeneous coordinates allow one to express vectors in N-dimensional space in an N+1 dimensional space (i.e., 2D points in 3D and 3D points in 4D)

$$P = \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} \qquad P' = \begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix}$$

- Each “real” point has infinitely many representations (e.g., $P' = wP$)
- Real point can be obtained by dividing all elements of homogeneous vector by the last

Aside: Camera Matrix

Homogeneous coordinates allow one to express vectors in N-dimensional space in an N+1 dimensional space (i.e., 2D points in 3D and 3D points in 4D)

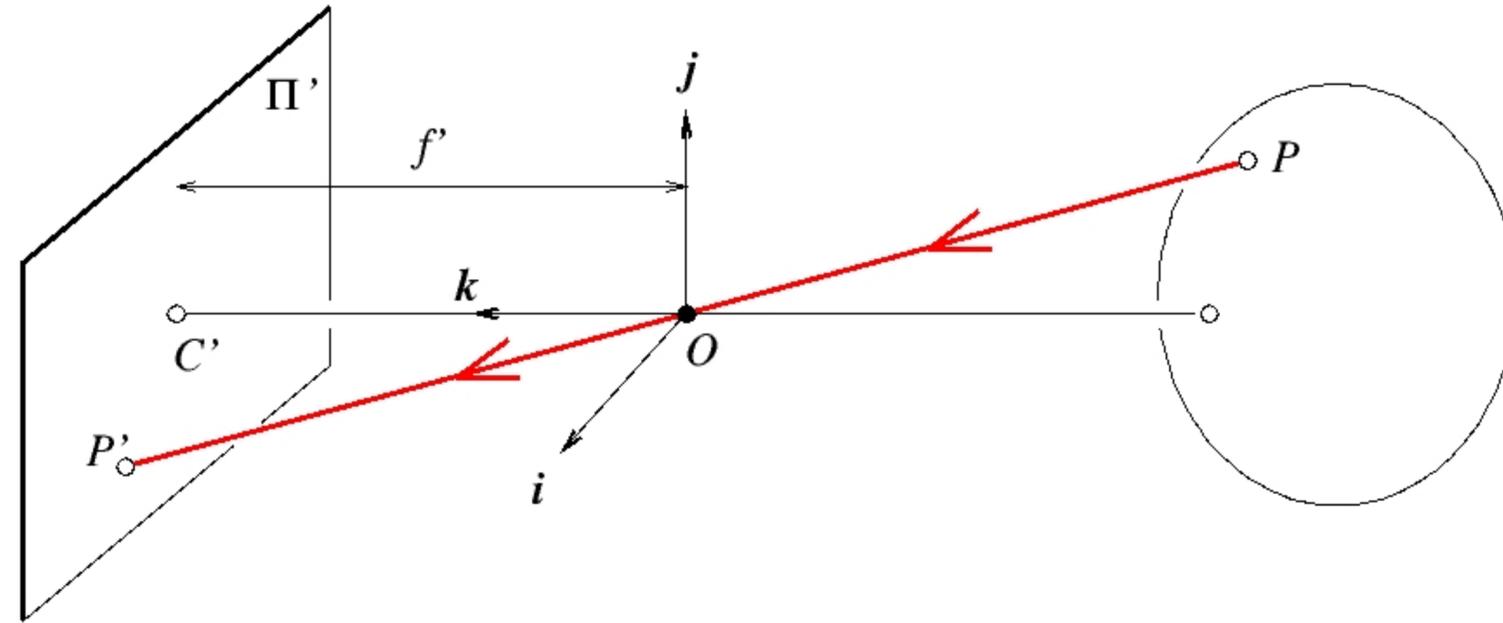

$$P = \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} \qquad P' = \begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix}$$

- Each “real” point has infinitely many representations (e.g., $P' = wP'$)
- Real point can be obtained by dividing all elements of homogeneous vector by the last

Why? allows for unified matrix math for geometric transformations (very convent for computer graphics and vision)

Aside: Camera Matrix

Camera Matrix

$$\mathbf{C} = \begin{bmatrix} f' & 0 & 0 & 0 \\ 0 & f' & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}$$

3D object point

Forsyth & Ponce (1st ed.) Figure 1.4

$P = \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$ projects to 2D image point $P' = \begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix}$ where $P' = \mathbf{C}P$

Note: this assumes world coordinate frame at the optical center (pinhole) and aligned with the image plane, image coordinate frame aligned with the camera coordinate frame

Aside: Camera Matrix

Camera Matrix

$$\mathbf{C} = \begin{bmatrix} f' & 0 & 0 & 0 \\ 0 & f' & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}$$

$$\begin{aligned} x' &= f' \frac{x}{z} \\ y' &= f' \frac{y}{z} \end{aligned}$$

$P = \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$ projects to 2D image point $P' = \begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix}$ where $P' = \mathbf{C}P$

Aside: Camera Matrix

Camera Matrix

$$\begin{aligned}x' &= f' \frac{x}{z} \\y' &= f' \frac{y}{z}\end{aligned}$$

$$\mathbf{C} = \begin{bmatrix} f' & 0 & 0 & 0 \\ 0 & f' & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}$$

$$\begin{bmatrix} f' & 0 & 0 & 0 \\ 0 & f' & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} = \begin{bmatrix} f'x \\ f'y \\ z \end{bmatrix} = \begin{bmatrix} \frac{f'x}{z} \\ \frac{f'y}{z} \\ 1 \end{bmatrix}$$

$$P = \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

projects to 2D image point

$$P' = \begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix}$$

where

$$P' = \mathbf{C}P$$

Aside: Camera Matrix

Camera Matrix

$$\mathbf{C} = \begin{bmatrix} f' & 0 & 0 & 0 \\ 0 & f' & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}$$

Pixels are squared / lens is perfectly symmetric

Sensor and pinhole perfectly aligned

Coordinate system centered at the pinhole

$$P = \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} \text{ projects to 2D image point } P' = \begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} \text{ where } P' = \mathbf{C}P$$

Aside: Camera Matrix

Camera Matrix

$$\mathbf{C} = \begin{bmatrix} f'_x & 0 & 0 & 0 \\ 0 & f'_y & 0 & 0 \\ 0 & 0 & 1 & 0 \end{bmatrix}$$

~~Pixels are squared / lens is perfectly symmetric~~

Sensor and pinhole perfectly aligned

Coordinate system centered at the pinhole

$$P = \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} \text{ projects to 2D image point } P' = \begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} \text{ where } P' = \mathbf{C}P$$

Aside: Camera Matrix

Camera Matrix

$$\mathbf{C} = \begin{bmatrix} f'_x & 0 & 0 & c_x \\ 0 & f'_y & 0 & c_y \\ 0 & 0 & 1 & 0 \end{bmatrix}$$

~~Pixels are squared / lens is perfectly symmetric~~

~~Sensor and pinhole perfectly aligned~~

Coordinate system centered at the pinhole

$$P = \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} \text{ projects to 2D image point } P' = \begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} \text{ where } P' = \mathbf{C}P$$

Aside: Camera Matrix

Camera Matrix

$$\mathbf{C} = \begin{bmatrix} f'_x & 0 & 0 & c_x \\ 0 & f'_y & 0 & c_y \\ 0 & 0 & 1 & 0 \end{bmatrix} \mathbb{R}_{4 \times 4}$$

~~Pixels are squared / lens is perfectly symmetric~~

~~Sensor and pinhole perfectly aligned~~

~~Coordinate system centered at the pinhole~~

$$P = \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} \text{ projects to 2D image point } P' = \begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} \text{ where } P' = \mathbf{C}P$$

Aside: Camera Matrix

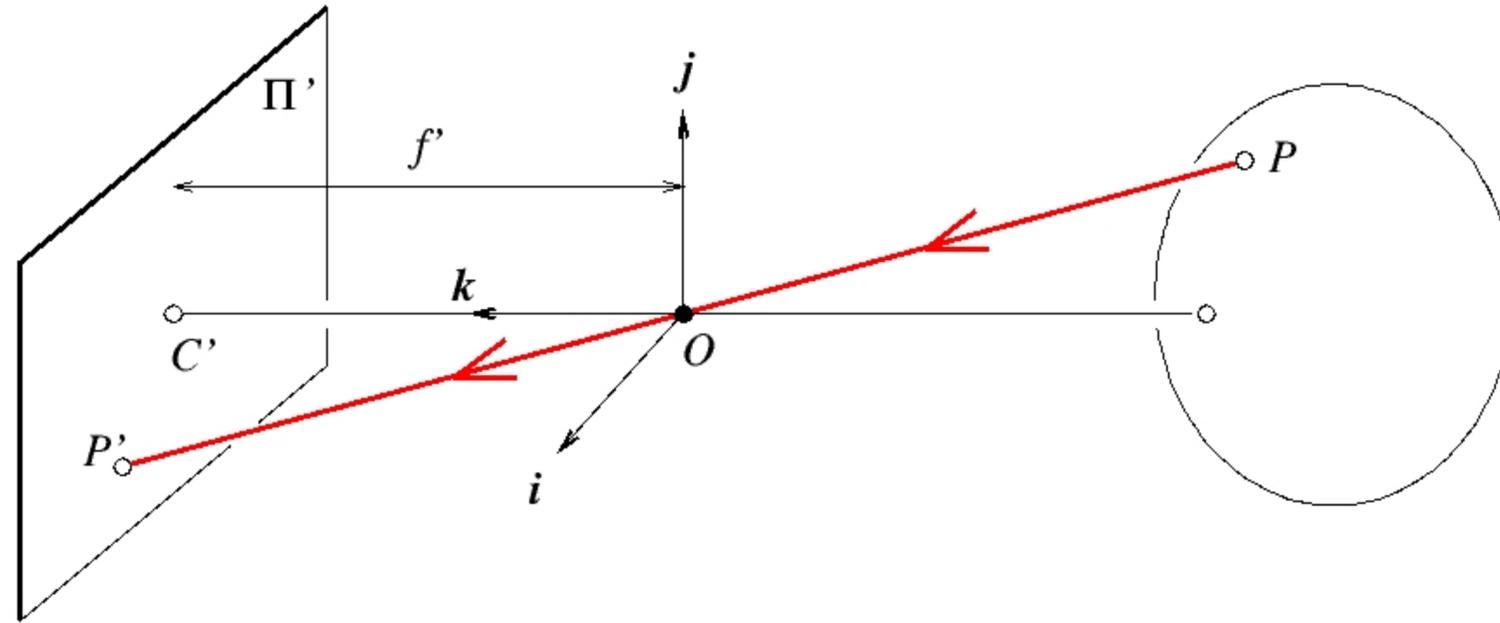

Camera Matrix

$$\mathbf{C} = \begin{bmatrix} f'_x & 0 & 0 & c_x \\ 0 & f'_y & 0 & c_y \\ 0 & 0 & 1 & 0 \end{bmatrix} \mathbb{R}_{4 \times 4}$$

Camera calibration is the process of estimating parameters of the camera matrix based on set of 3D-2D correspondences (usually requires a pattern whose structure and size is known)

$$P = \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} \text{ projects to 2D image point } P' = \begin{bmatrix} x' \\ y' \\ 1 \end{bmatrix} \text{ where } P' = \mathbf{C}P$$

Perspective Projection

3D object point

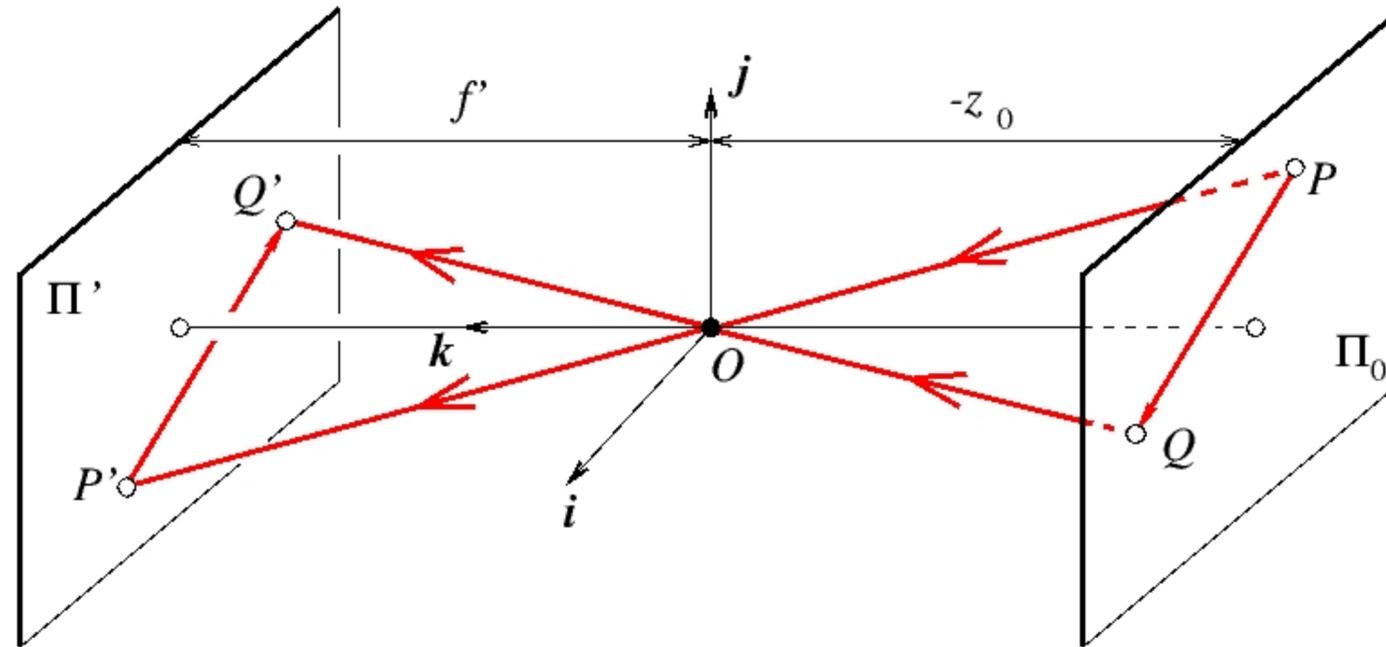

Forsyth & Ponce (1st ed.) Figure 1.4

$P = \begin{bmatrix} x \\ y \\ z \end{bmatrix}$ projects to 2D image point $P' = \begin{bmatrix} x' \\ y' \end{bmatrix}$ where

$$\begin{aligned} x' &= f' \frac{x}{z} \\ y' &= f' \frac{y}{z} \end{aligned}$$

Note: this assumes world coordinate frame at the optical center (pinhole) and aligned with the image plane, image coordinate frame aligned with the camera coordinate frame

Weak Perspective

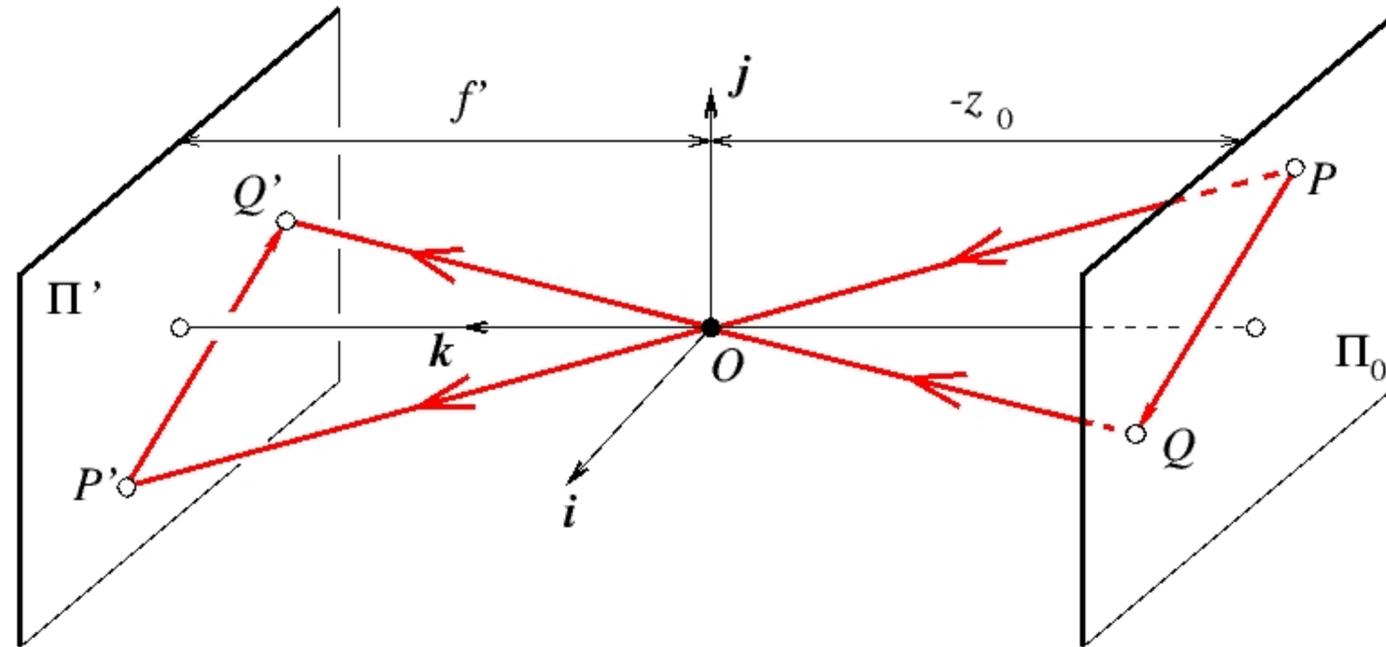

Forsyth & Ponce (1st ed.) Figure 1.5

3D object point $P = \begin{bmatrix} x \\ y \\ z \end{bmatrix}$ in Π_0 projects to 2D image point $P' = \begin{bmatrix} x' \\ y' \end{bmatrix}$

where $\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} mx \\ my \end{bmatrix}$ and $m = \frac{f'}{z_0}$

Weak Perspective

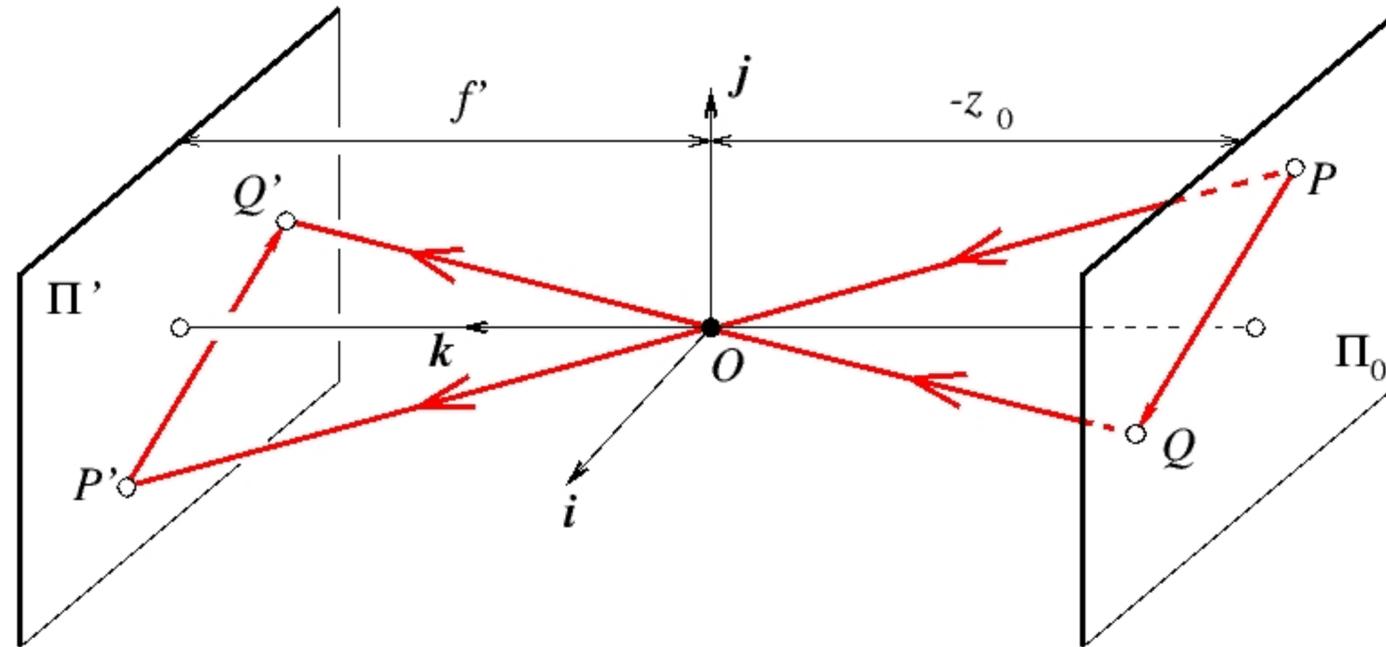

Forsyth & Ponce (1st ed.) Figure 1.5

When would this approximation be **accurate**?

3D object point $P = \begin{bmatrix} x \\ y \\ z \end{bmatrix}$ in Π_0 projects to 2D image point $P' = \begin{bmatrix} x' \\ y' \end{bmatrix}$

where $\begin{bmatrix} x' \\ y' \end{bmatrix} = \begin{bmatrix} mx \\ my \end{bmatrix}$ and $m = \frac{f'}{z_0}$

Weak Perspective

Forsyth & Ponce (1st ed.) Figure 1.5

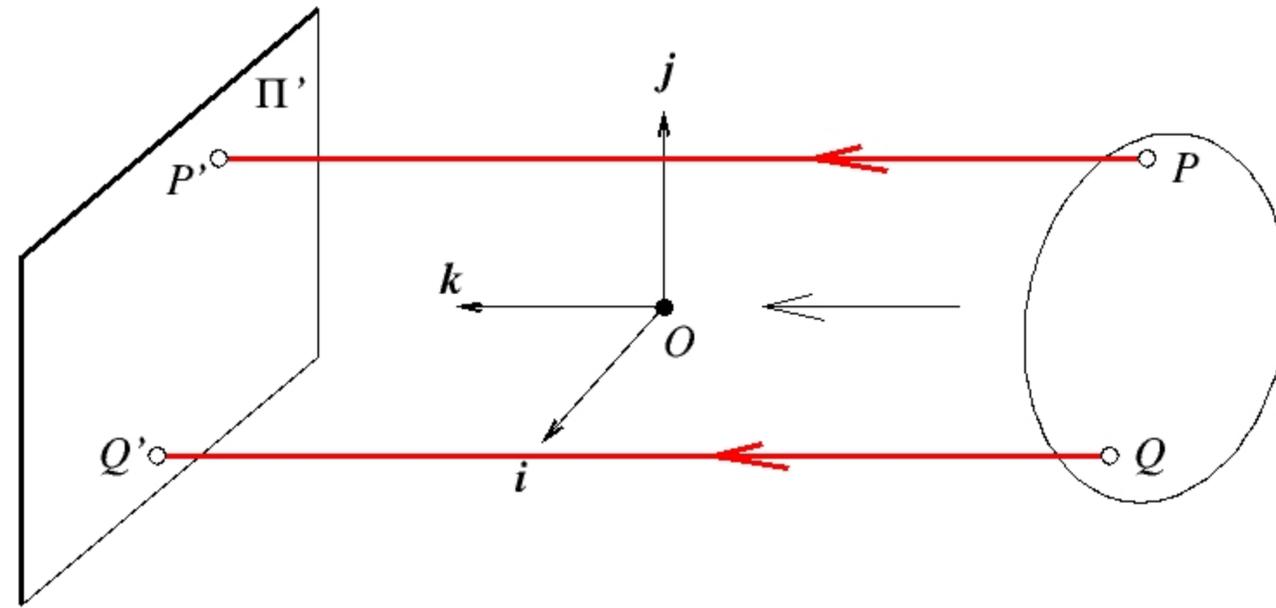

How do we set m ?

When would this approximation be **accurate**?

3D object point $P = \begin{bmatrix} x \\ y \\ z \end{bmatrix}$ in Π_0 projects to 2D image point $P' = \begin{bmatrix} x' \\ y' \end{bmatrix}$

where $\boxed{\begin{matrix} x' & = & mx \\ y' & = & my \end{matrix}}$ and $m = \frac{f'}{z_0}$

Orthographic Projection

Forsyth & Ponce (1st ed.) Figure 1.6

3D object point $P = \begin{bmatrix} x \\ y \\ z \end{bmatrix}$ projects to 2D image point $P' = \begin{bmatrix} x' \\ y' \end{bmatrix}$

where

$$\begin{array}{l} x' = x \\ y' = y \end{array}$$

Summary of **Projection Equations**

3D object point $P = \begin{bmatrix} x \\ y \\ z \end{bmatrix}$ projects to 2D image point $P' = \begin{bmatrix} x' \\ y' \end{bmatrix}$ where

Perspective

$$\begin{aligned} x' &= f' \frac{x}{z} \\ y' &= f' \frac{y}{z} \end{aligned}$$

Weak Perspective

$$\begin{aligned} x' &= m x \\ y' &= m y \end{aligned} \quad m = \frac{f'}{z_0}$$

Orthographic

$$\begin{aligned} x' &= x \\ y' &= y \end{aligned}$$

Projection Models: Pros and Cons

Weak perspective (including orthographic) has simpler mathematics

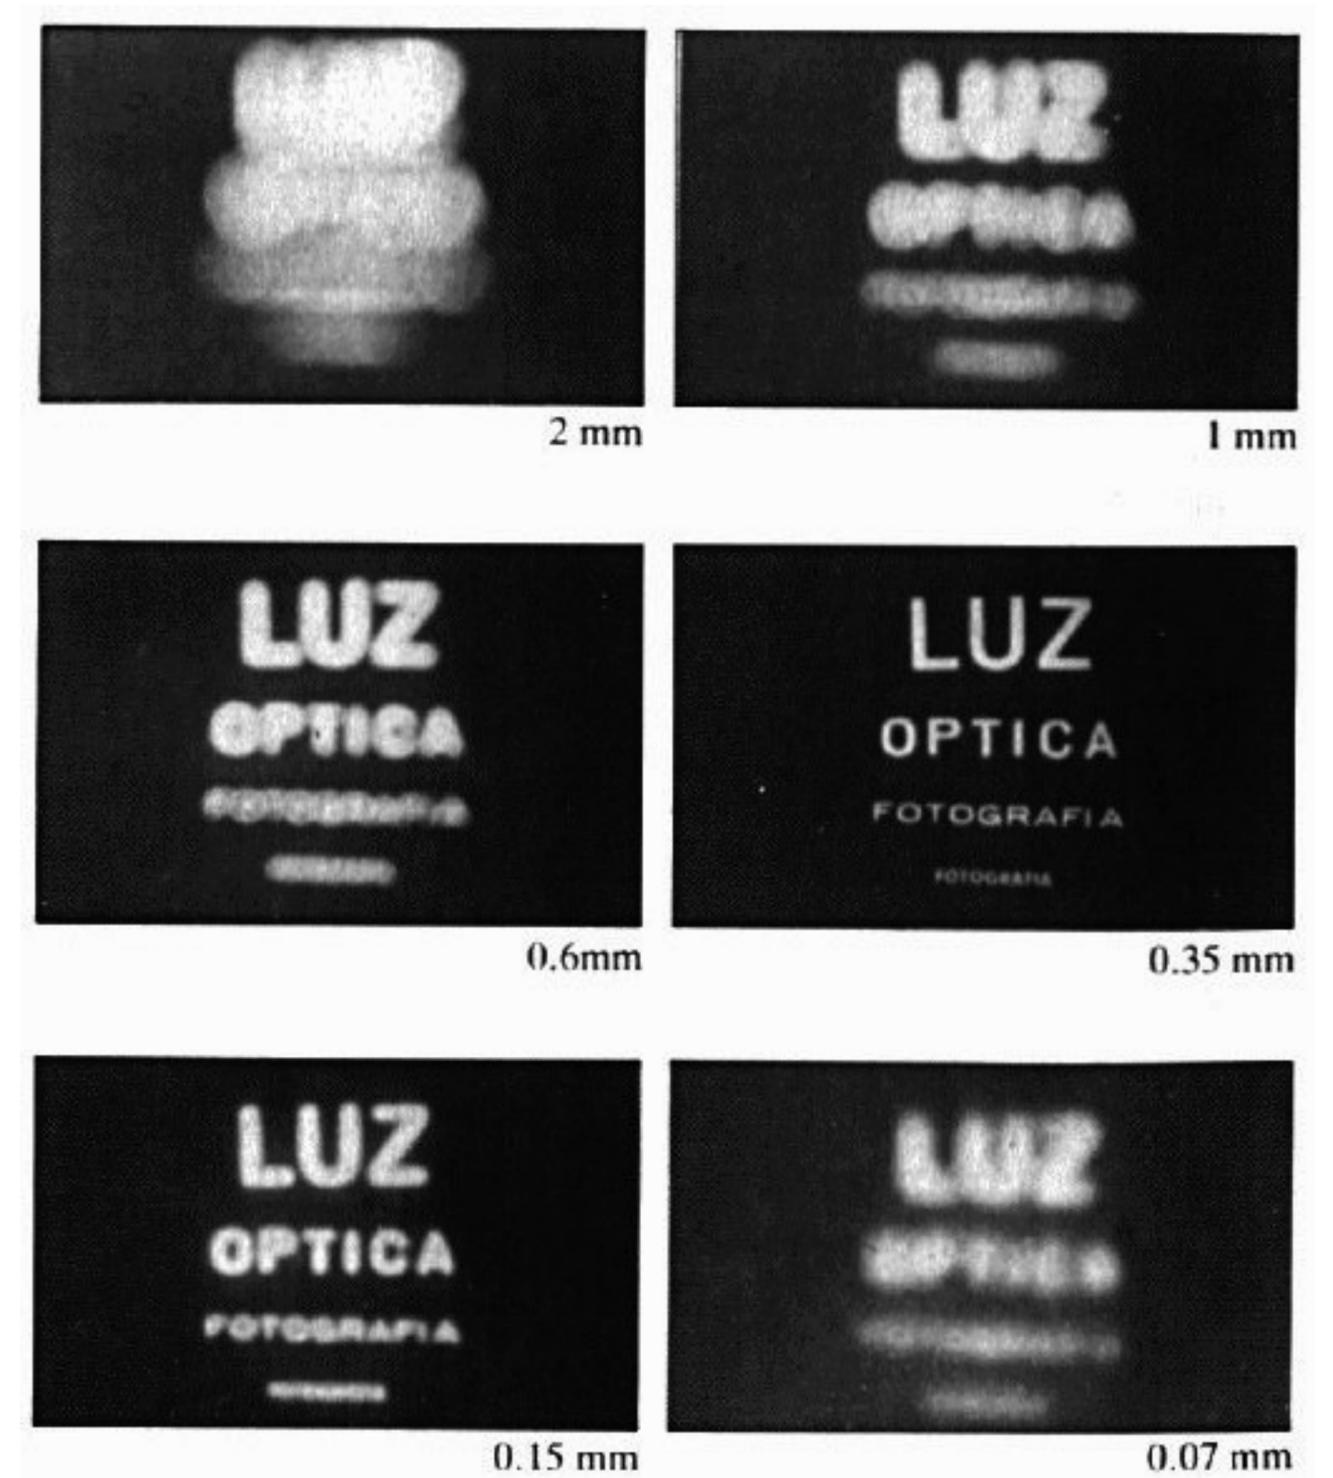

- accurate when object is small and/or distant
- useful for recognition

Perspective is more accurate for real scenes

When **maximum accuracy** is required, it is necessary to model additional details of a particular camera

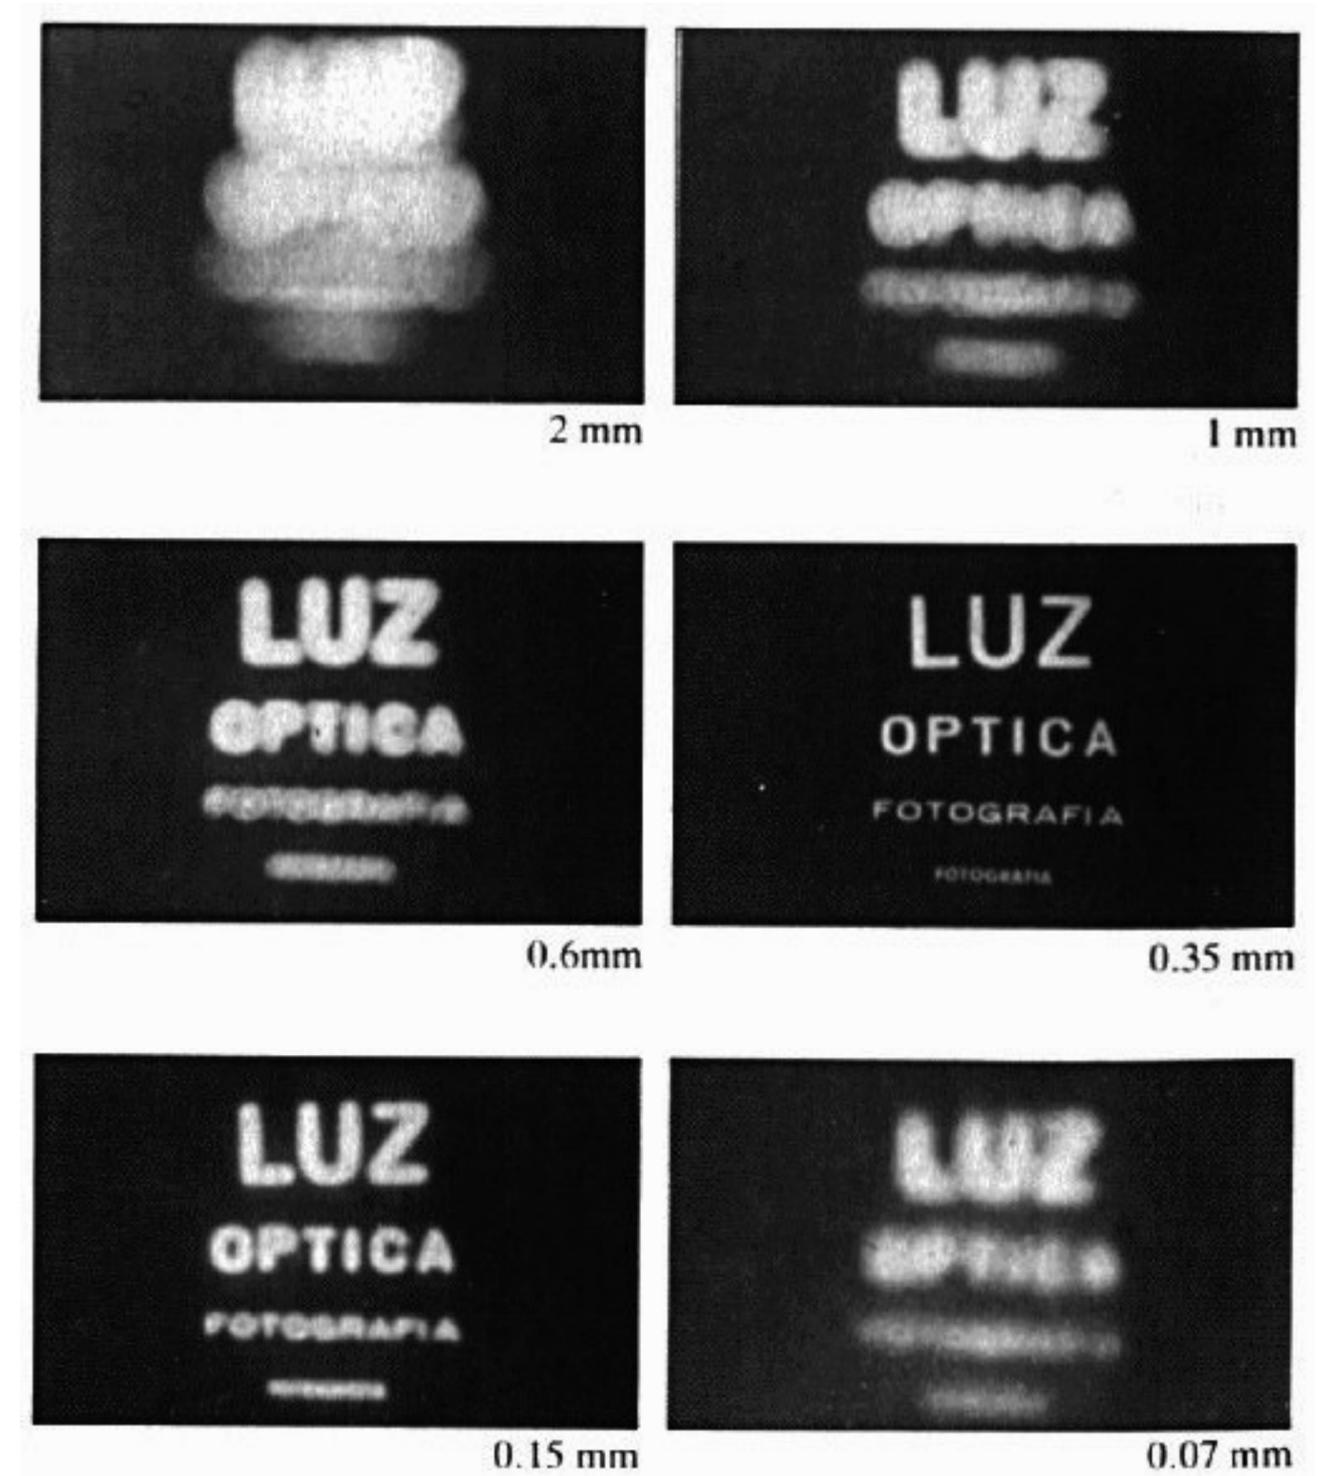

- use perspective projection with additional parameters (e.g., lens distortion)

Why **Not** a Pinhole Camera?

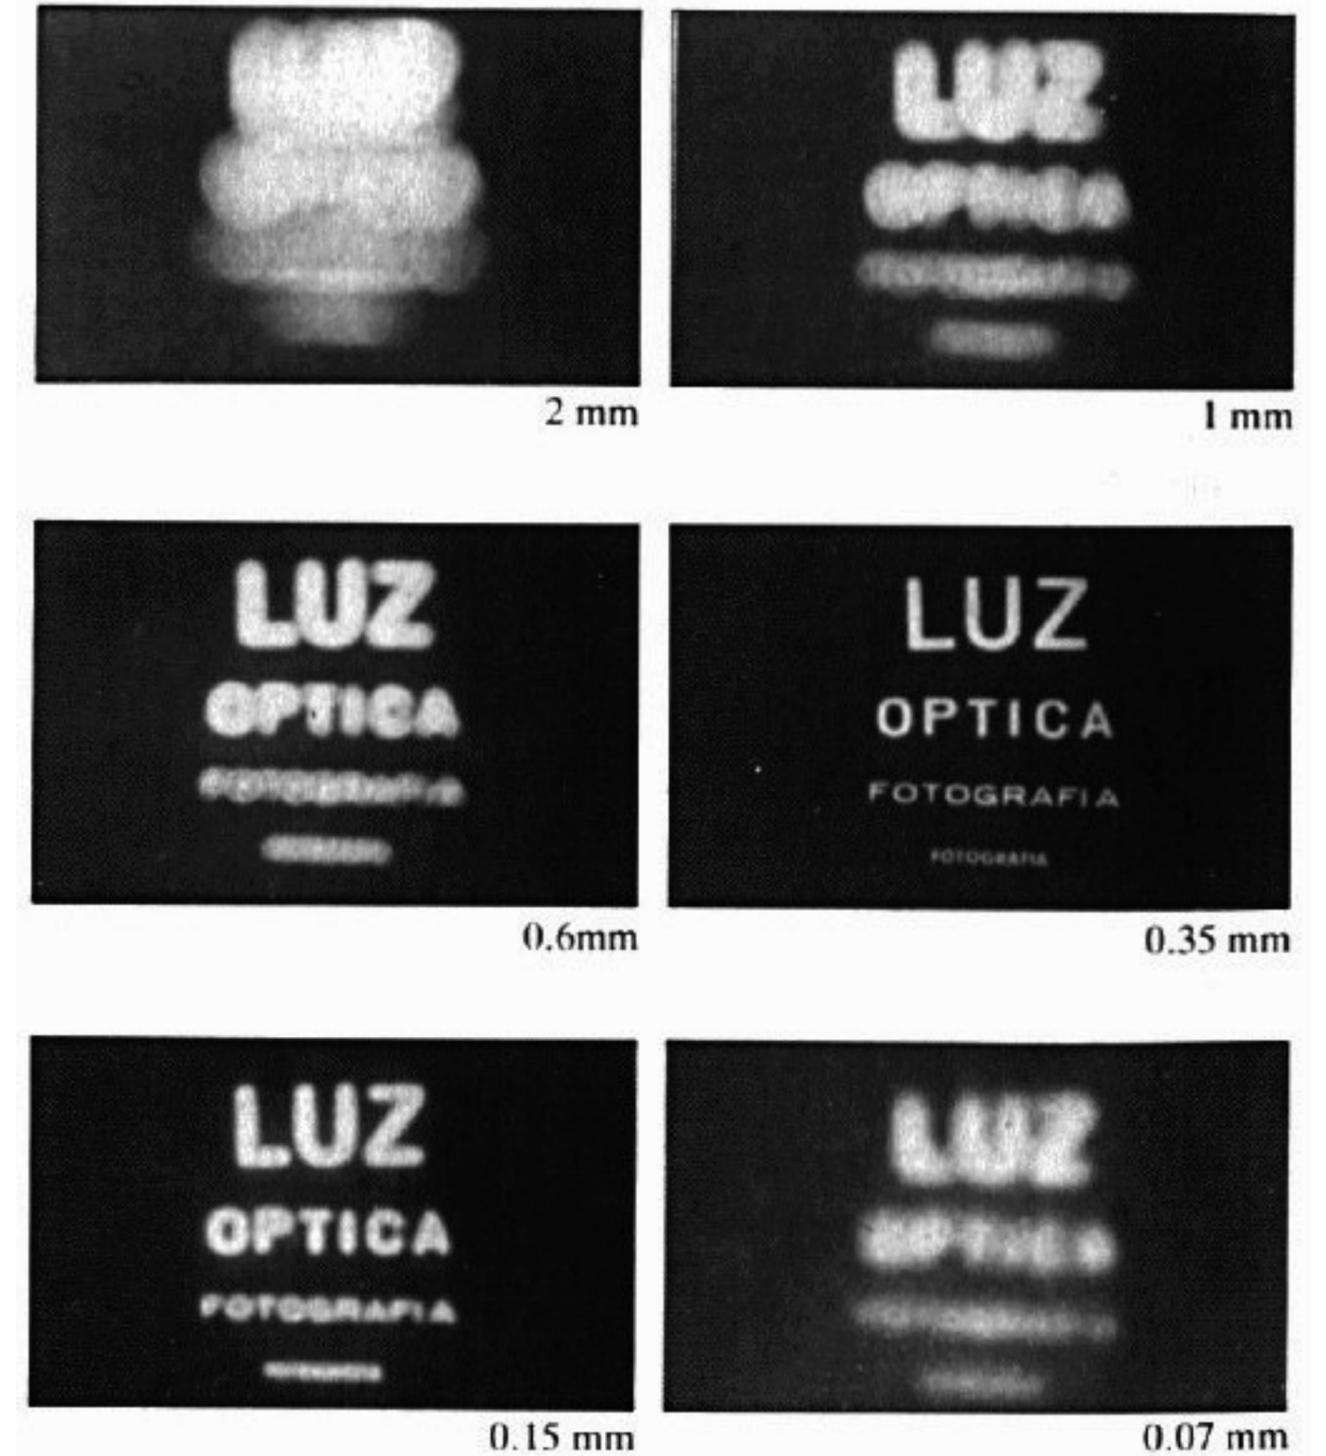

Why **Not** a Pinhole Camera?

- If pinhole is **too big** then many directions are averaged, blurring the image

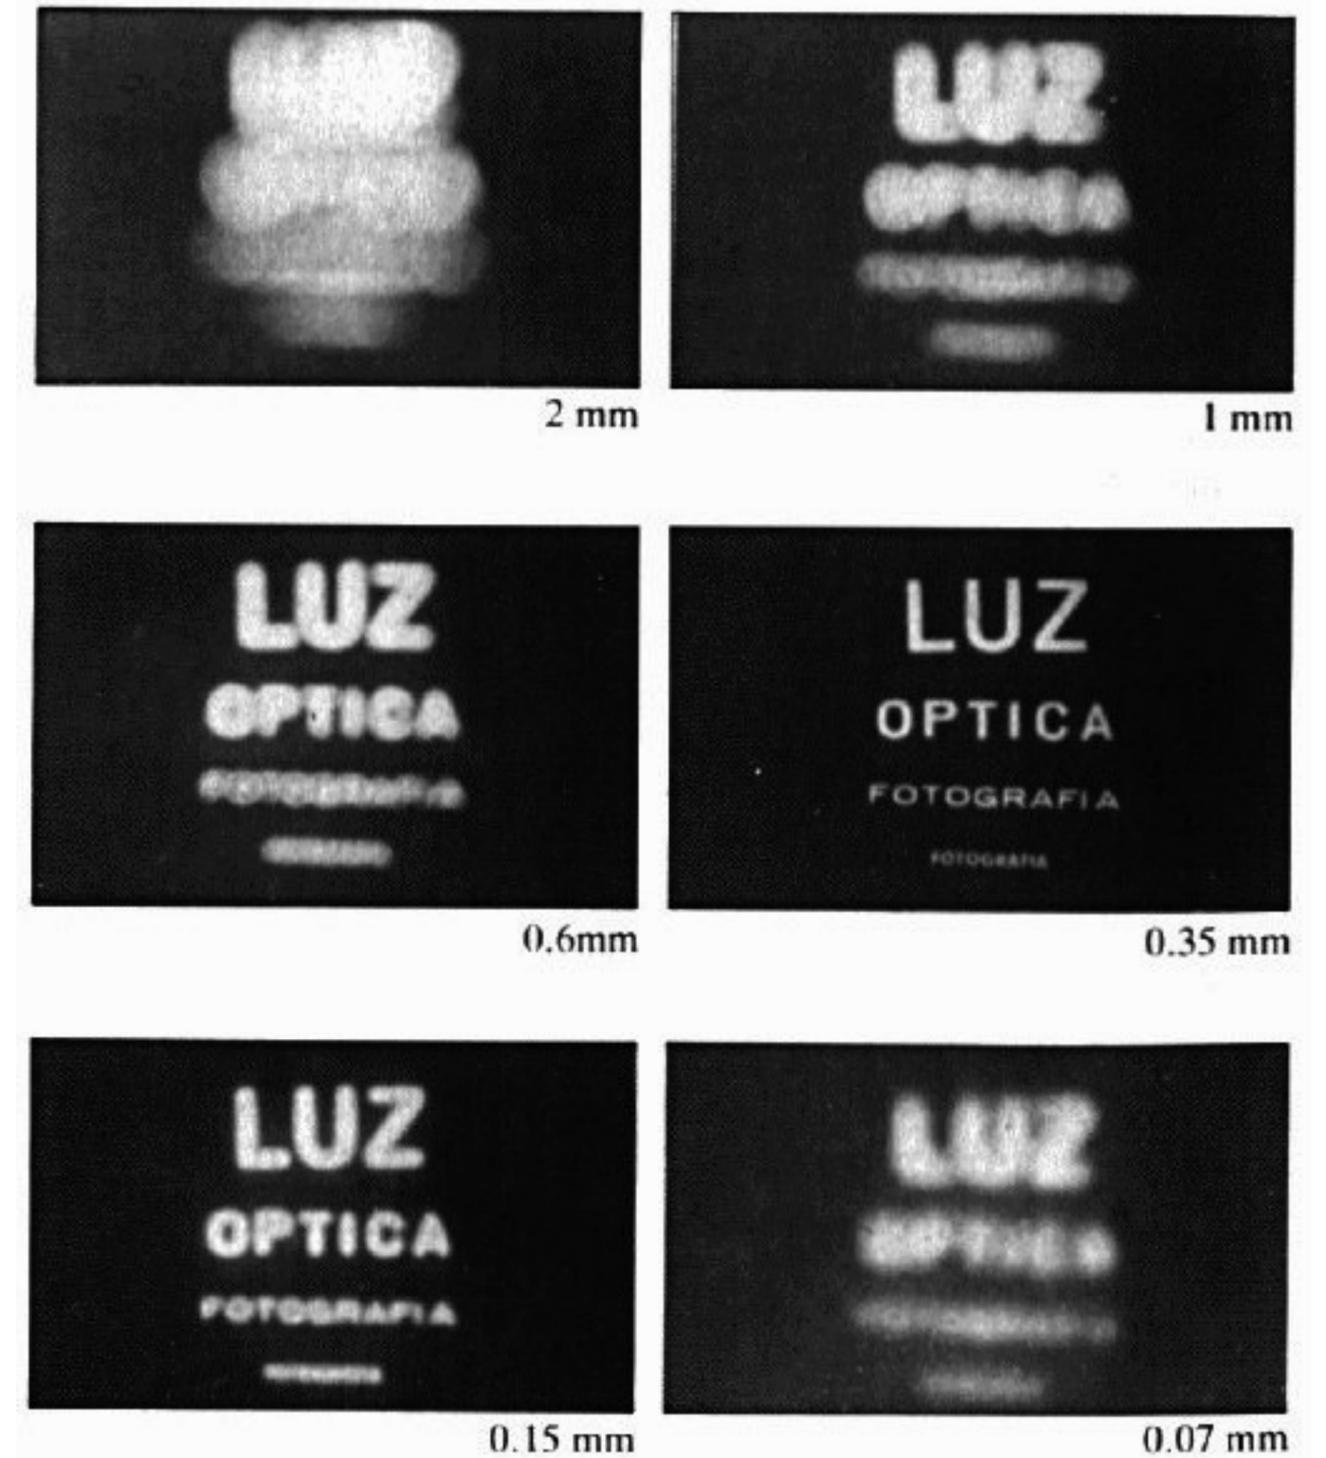

Why **Not** a Pinhole Camera?

- If pinhole is **too big** then many directions are averaged, blurring the image
- If pinhole is **too small** then diffraction becomes a factor, also blurring the image

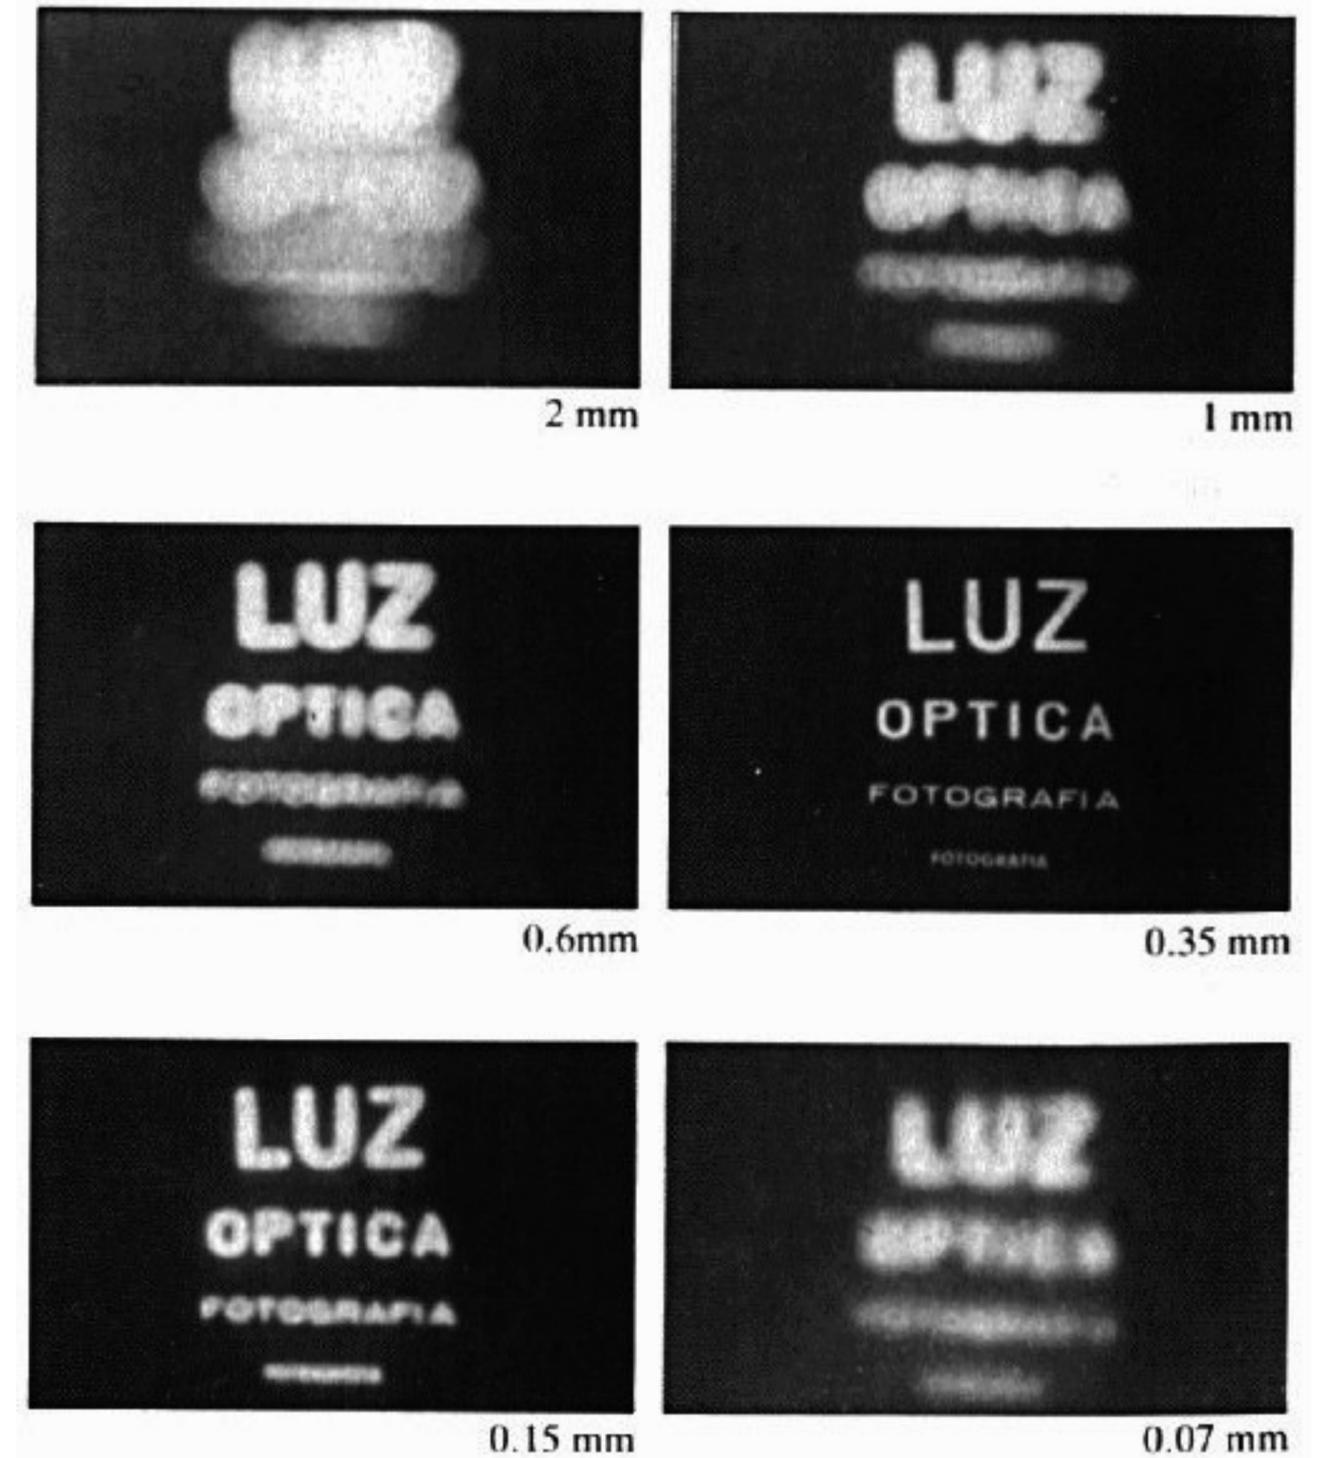

Why **Not** a Pinhole Camera?

- If pinhole is **too big** then many directions are averaged, blurring the image
- If pinhole is **too small** then diffraction becomes a factor, also blurring the image
- Generally, pinhole cameras are **dark**, because only a very small set of rays from a particular scene point hits the image plane

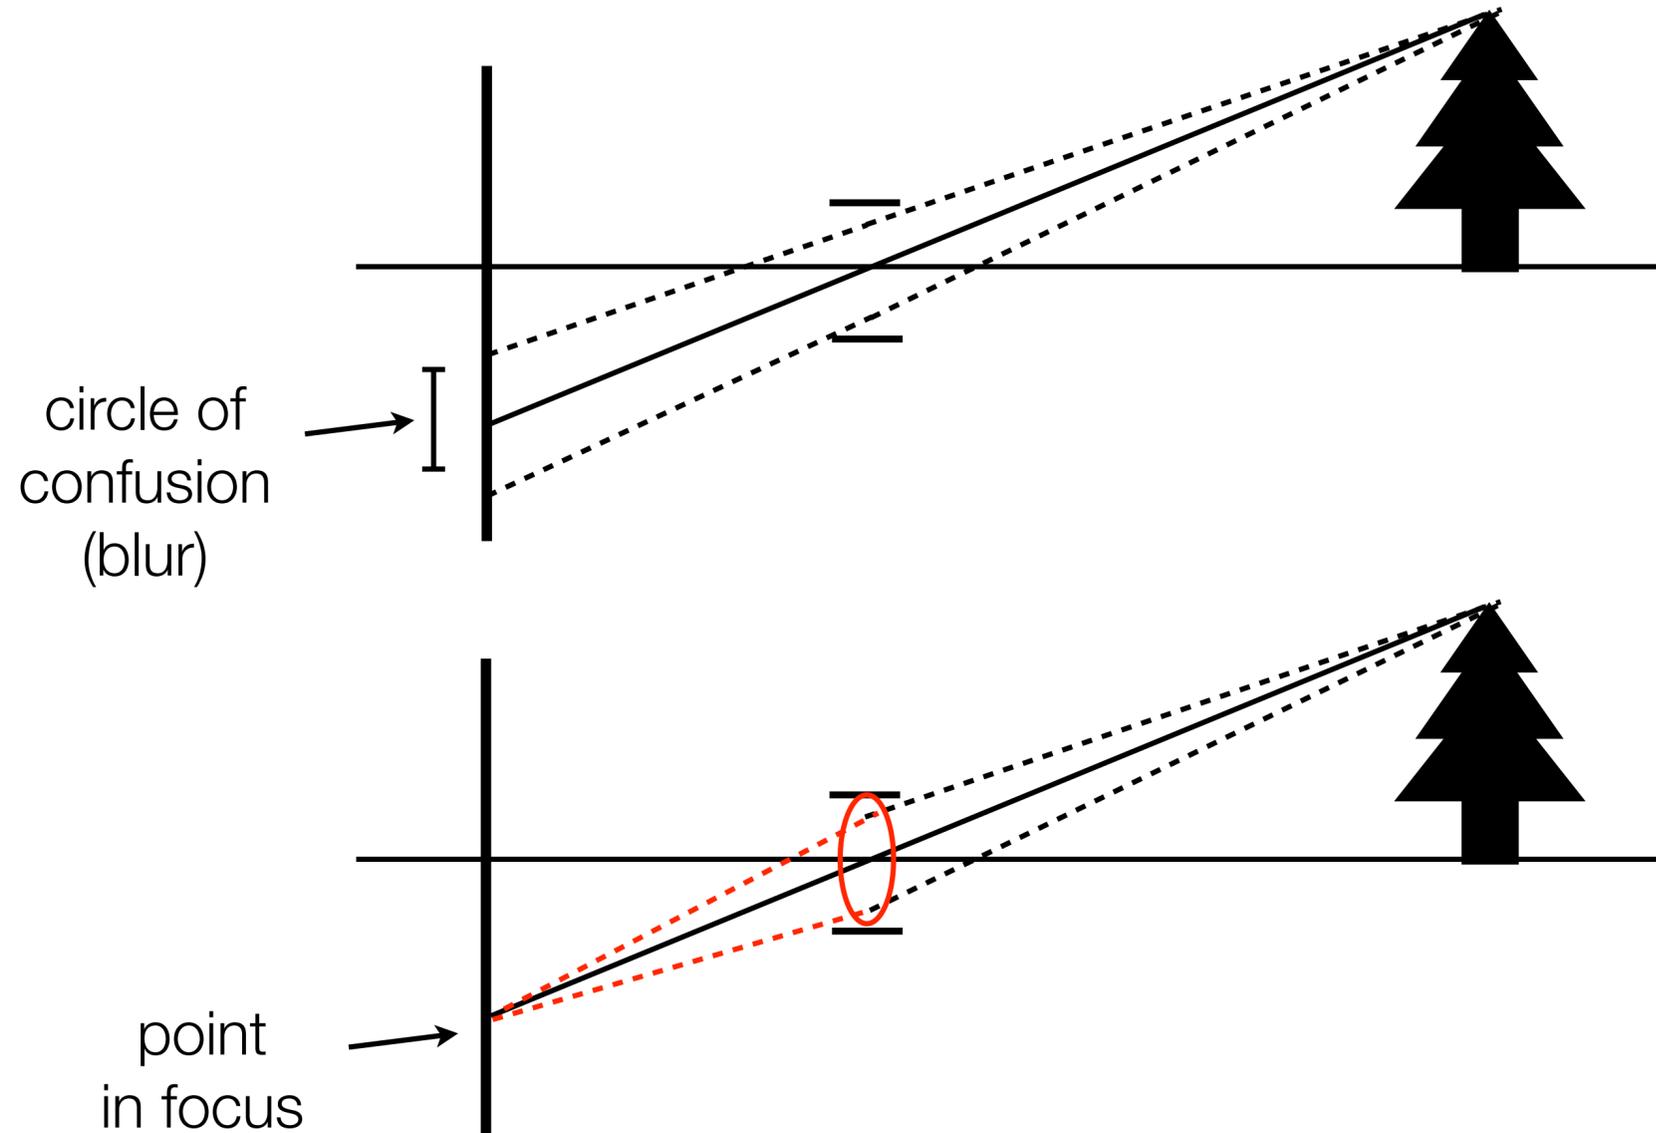

Why **Not** a Pinhole Camera?

- If pinhole is **too big** then many directions are averaged, blurring the image
- If pinhole is **too small** then diffraction becomes a factor, also blurring the image
- Generally, pinhole cameras are **dark**, because only a very small set of rays from a particular scene point hits the image plane
- Pinhole cameras are **slow**, because only a very small amount of light from a particular scene point hits the image plane per unit time

Reason for **Lenses**

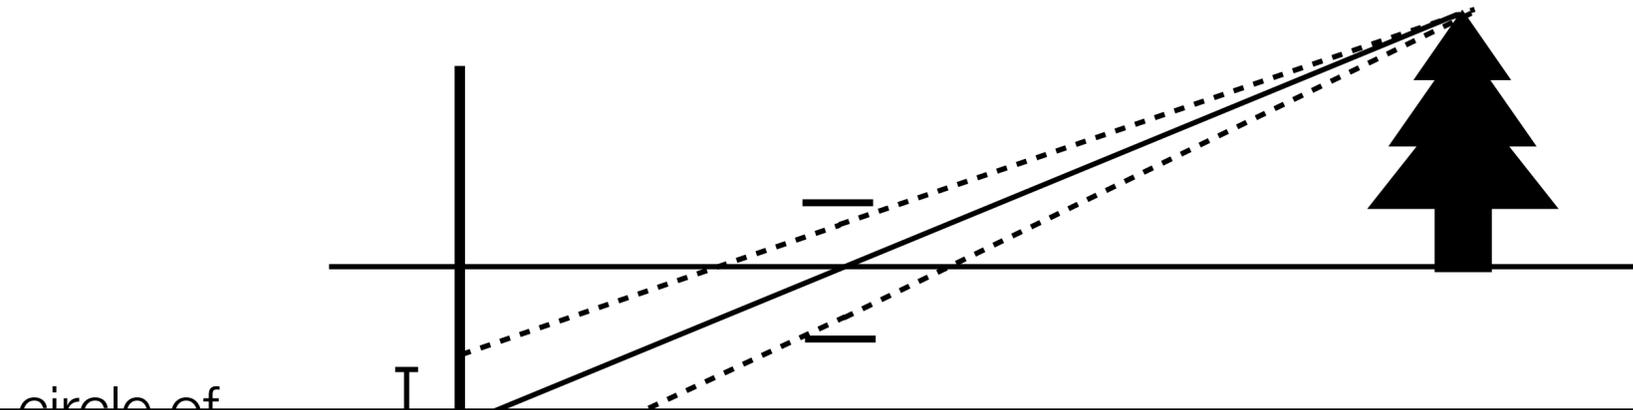

A real camera must have a finite aperture to get enough light, but this causes blur in the image

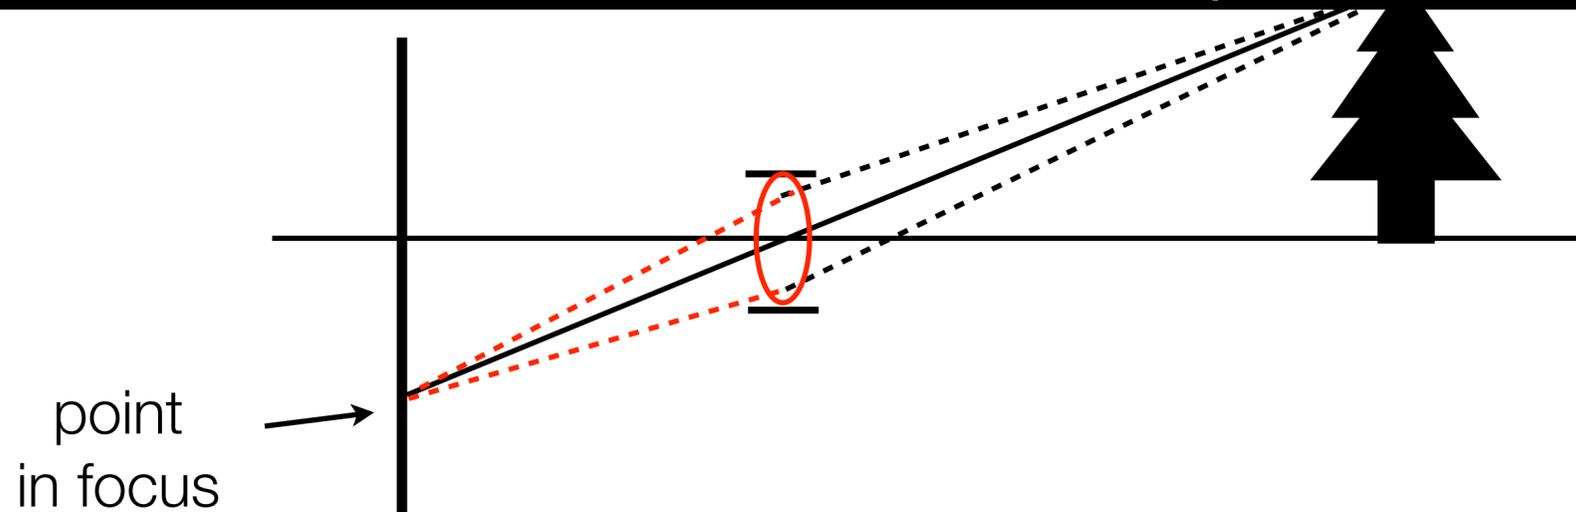

Solution: use a **lens** to focus light onto the image plane

Reason for **Lenses**

A real camera must have a finite aperture to get enough light, but this causes blur in the image

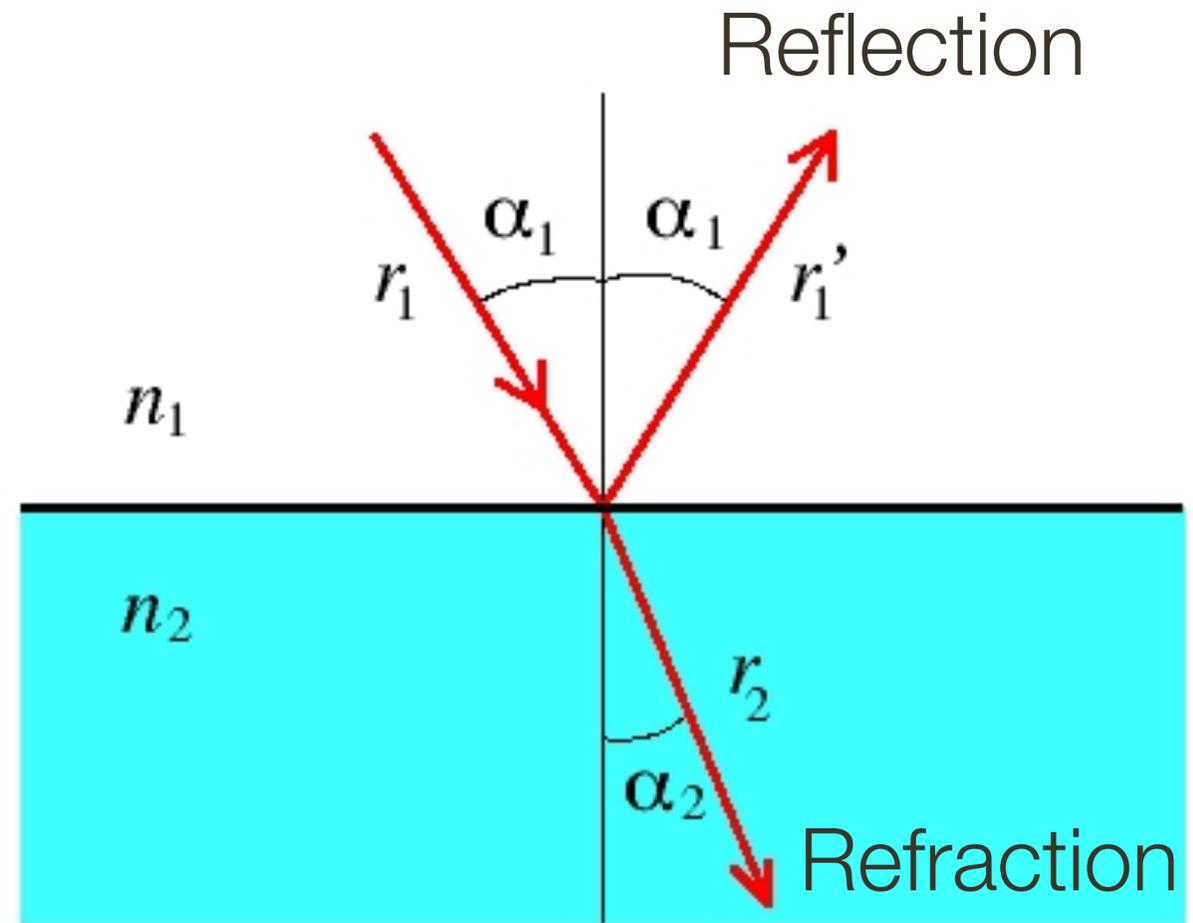

The role of a lens is to **capture more light** while preserving, as much as possible, the abstraction of an ideal pinhole camera.

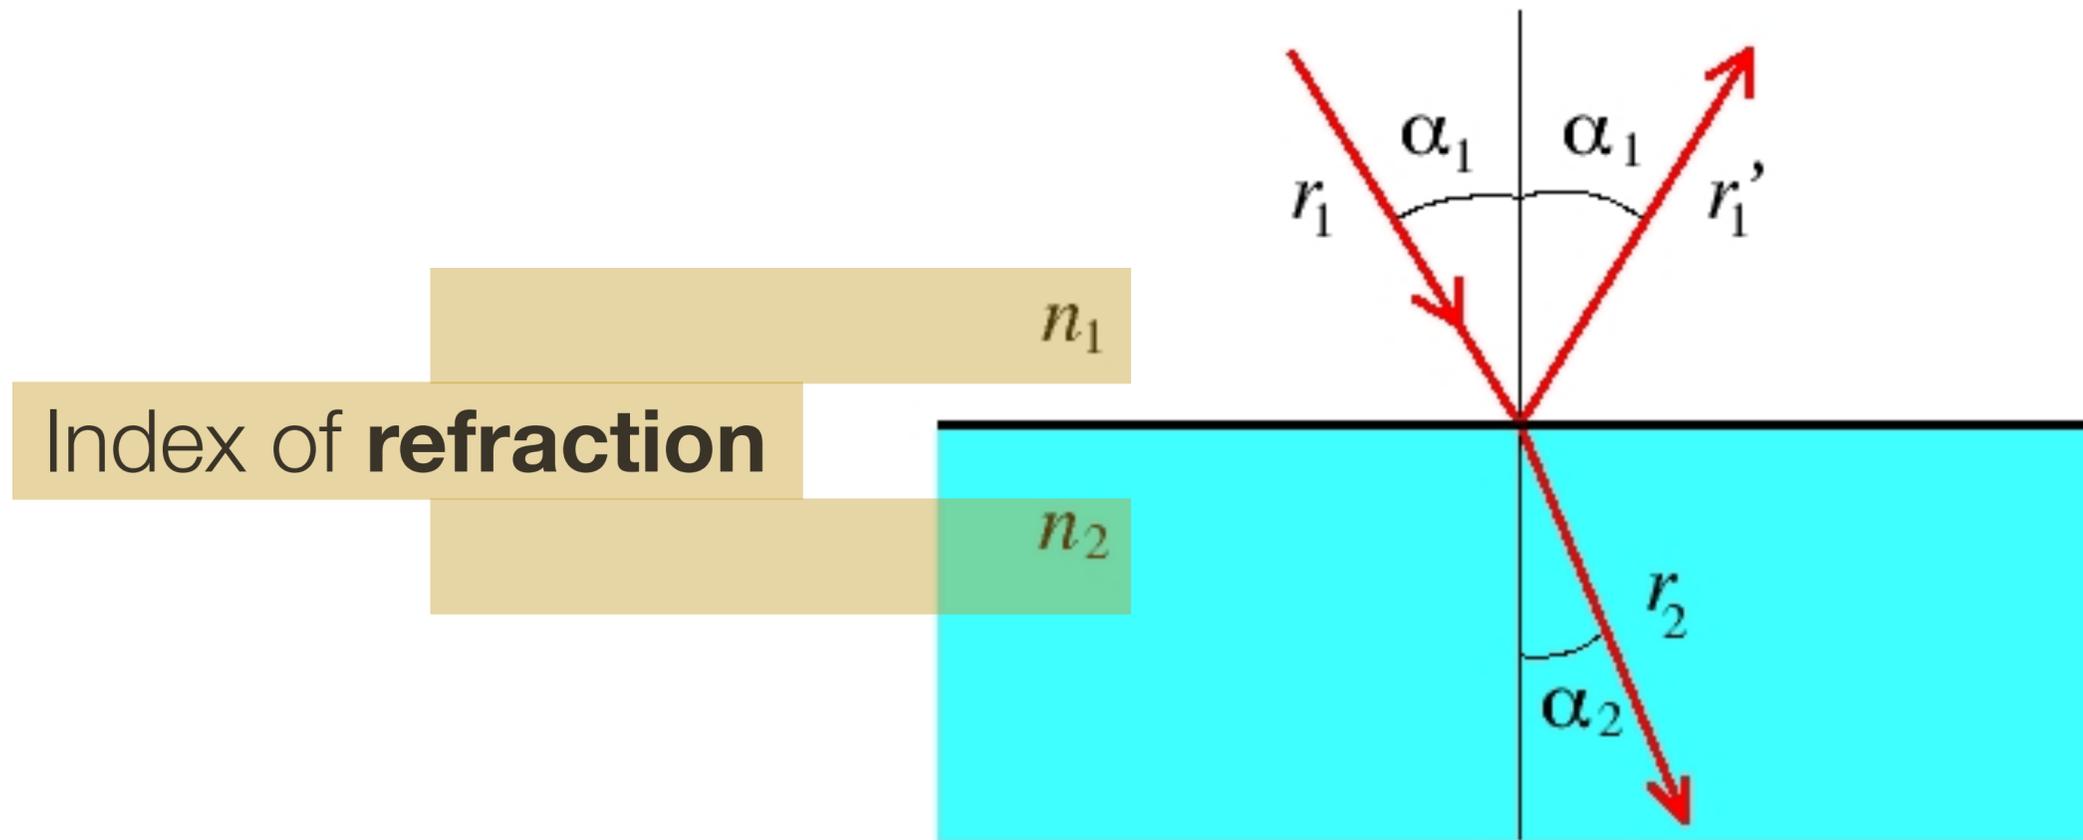

Solution: use a **lens** to focus light onto the image plane

Snell's Law

$$n_1 \sin \alpha_1 = n_2 \sin \alpha_2$$

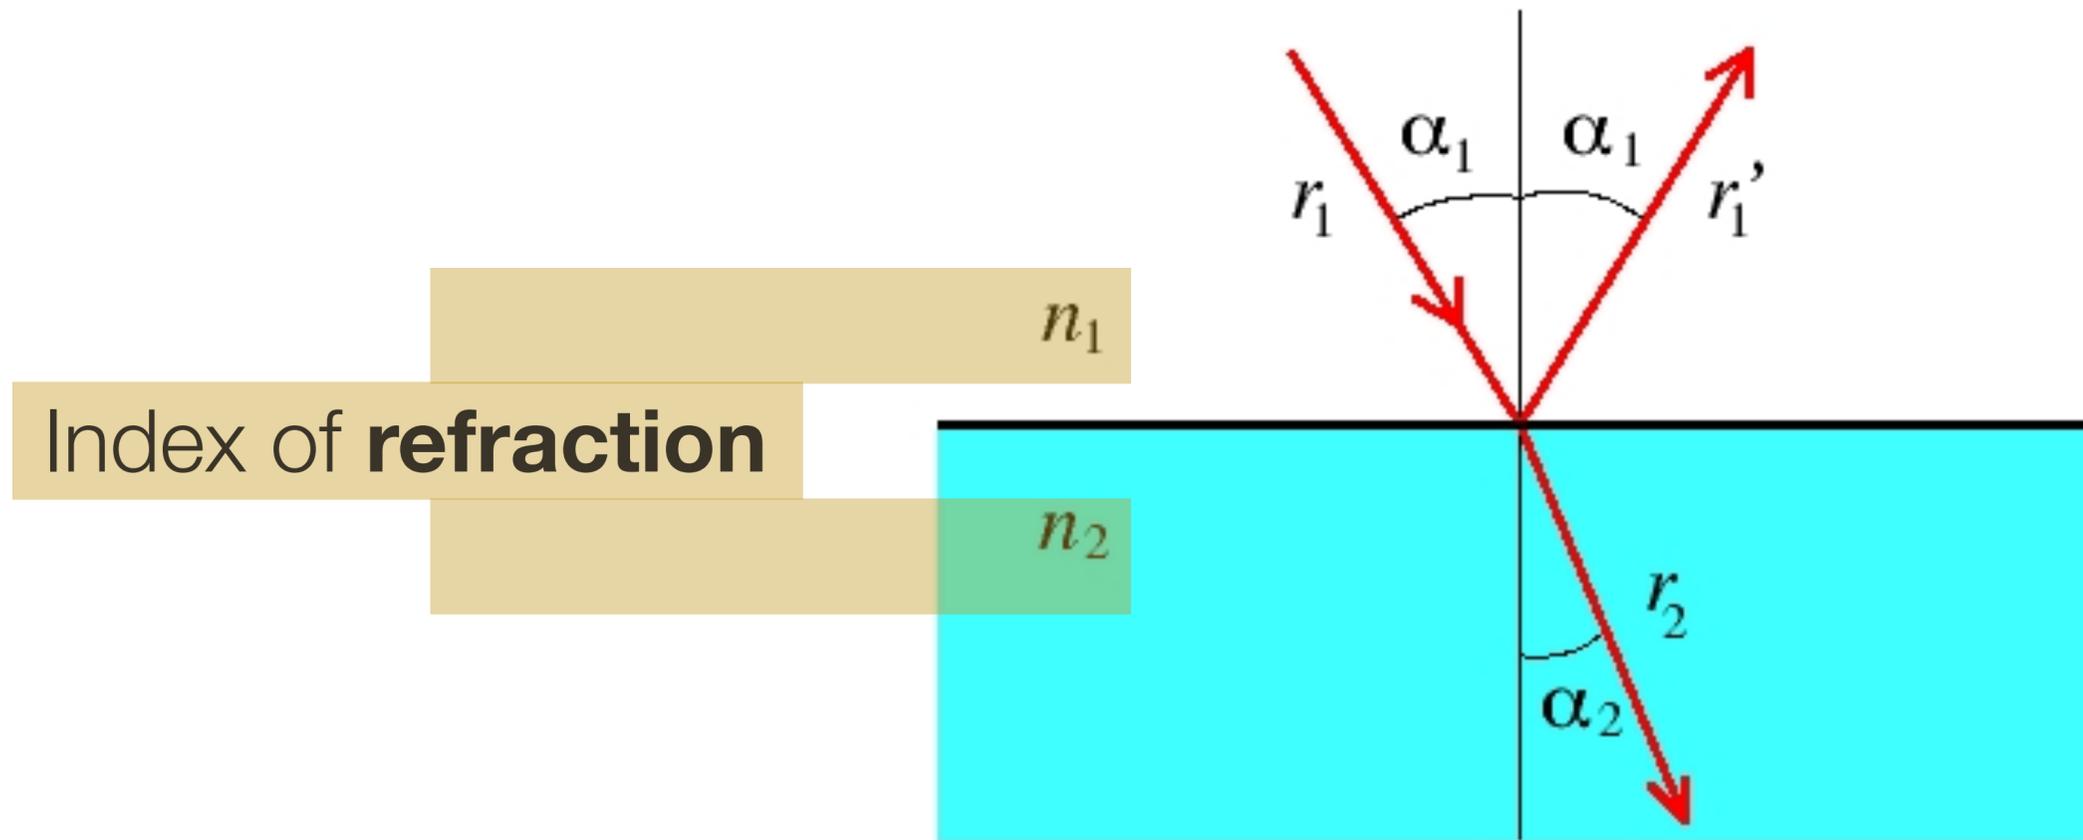

Snell's Law

$$n_1 \sin \alpha_1 = n_2 \sin \alpha_2$$

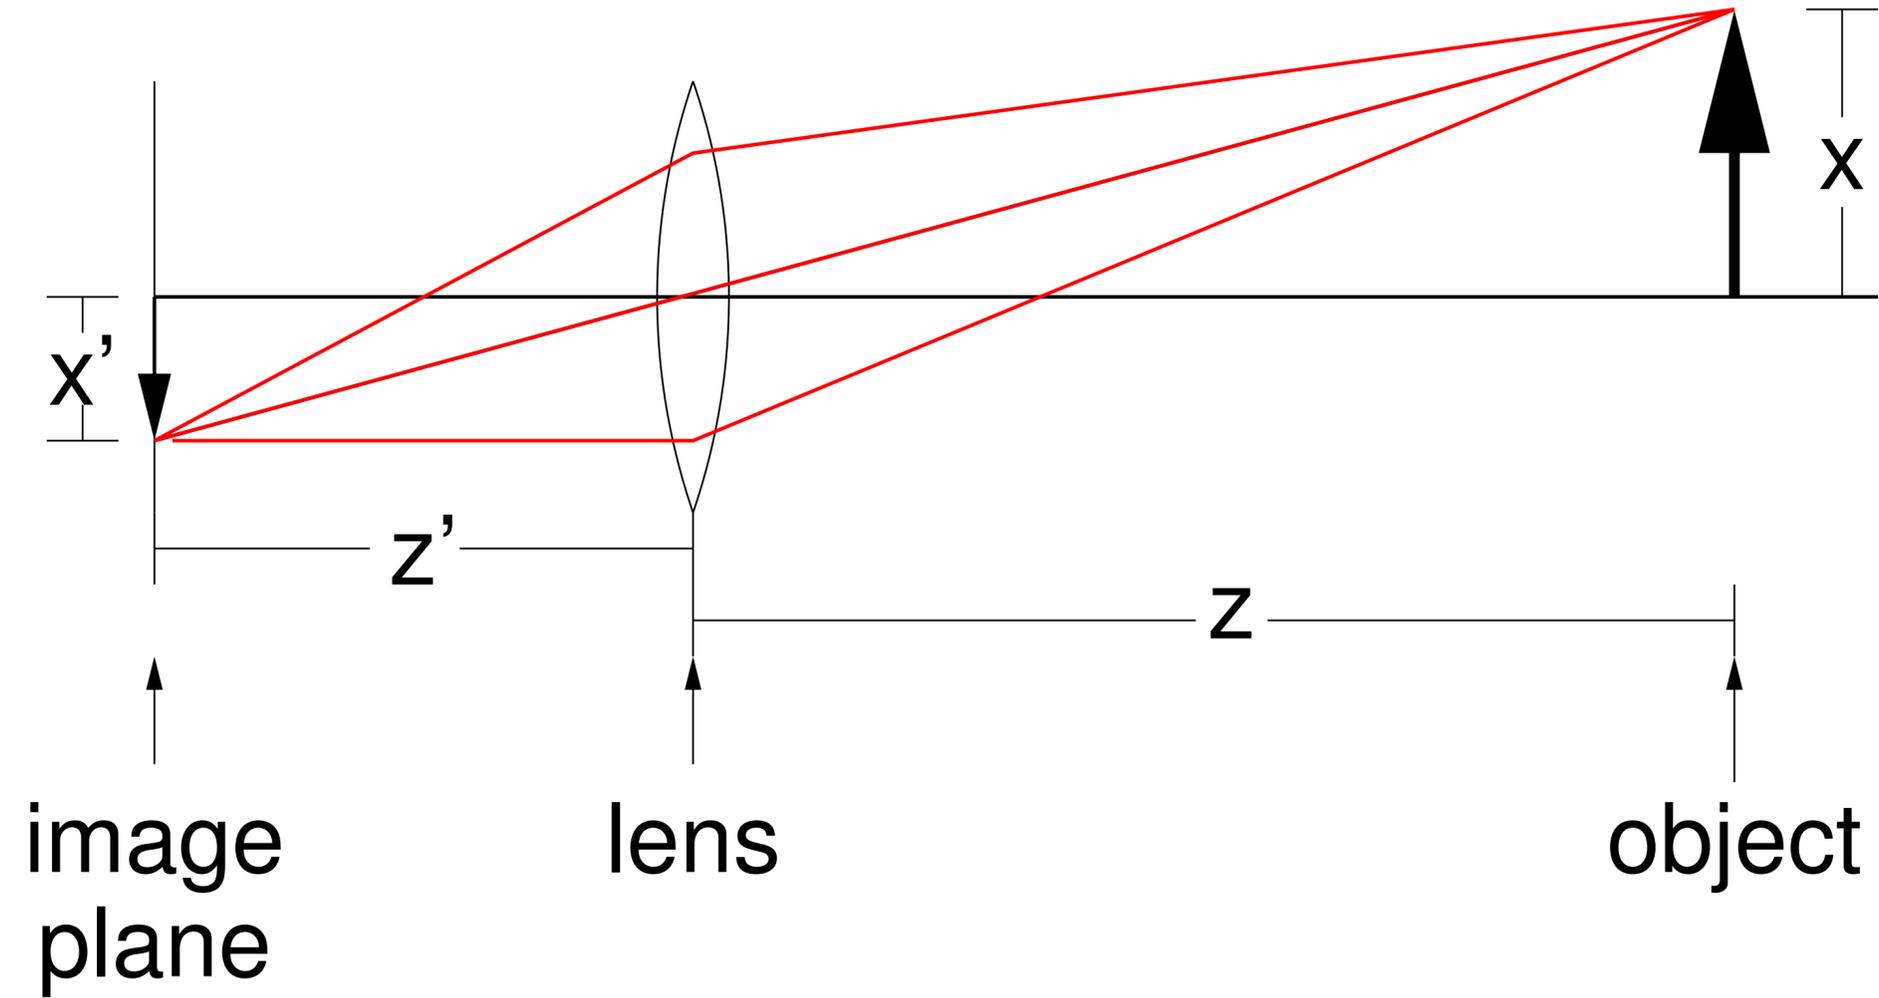

Snell's Law

Exercise: Would it make sense to make the lens from material whose index of refraction equals to air? Why?

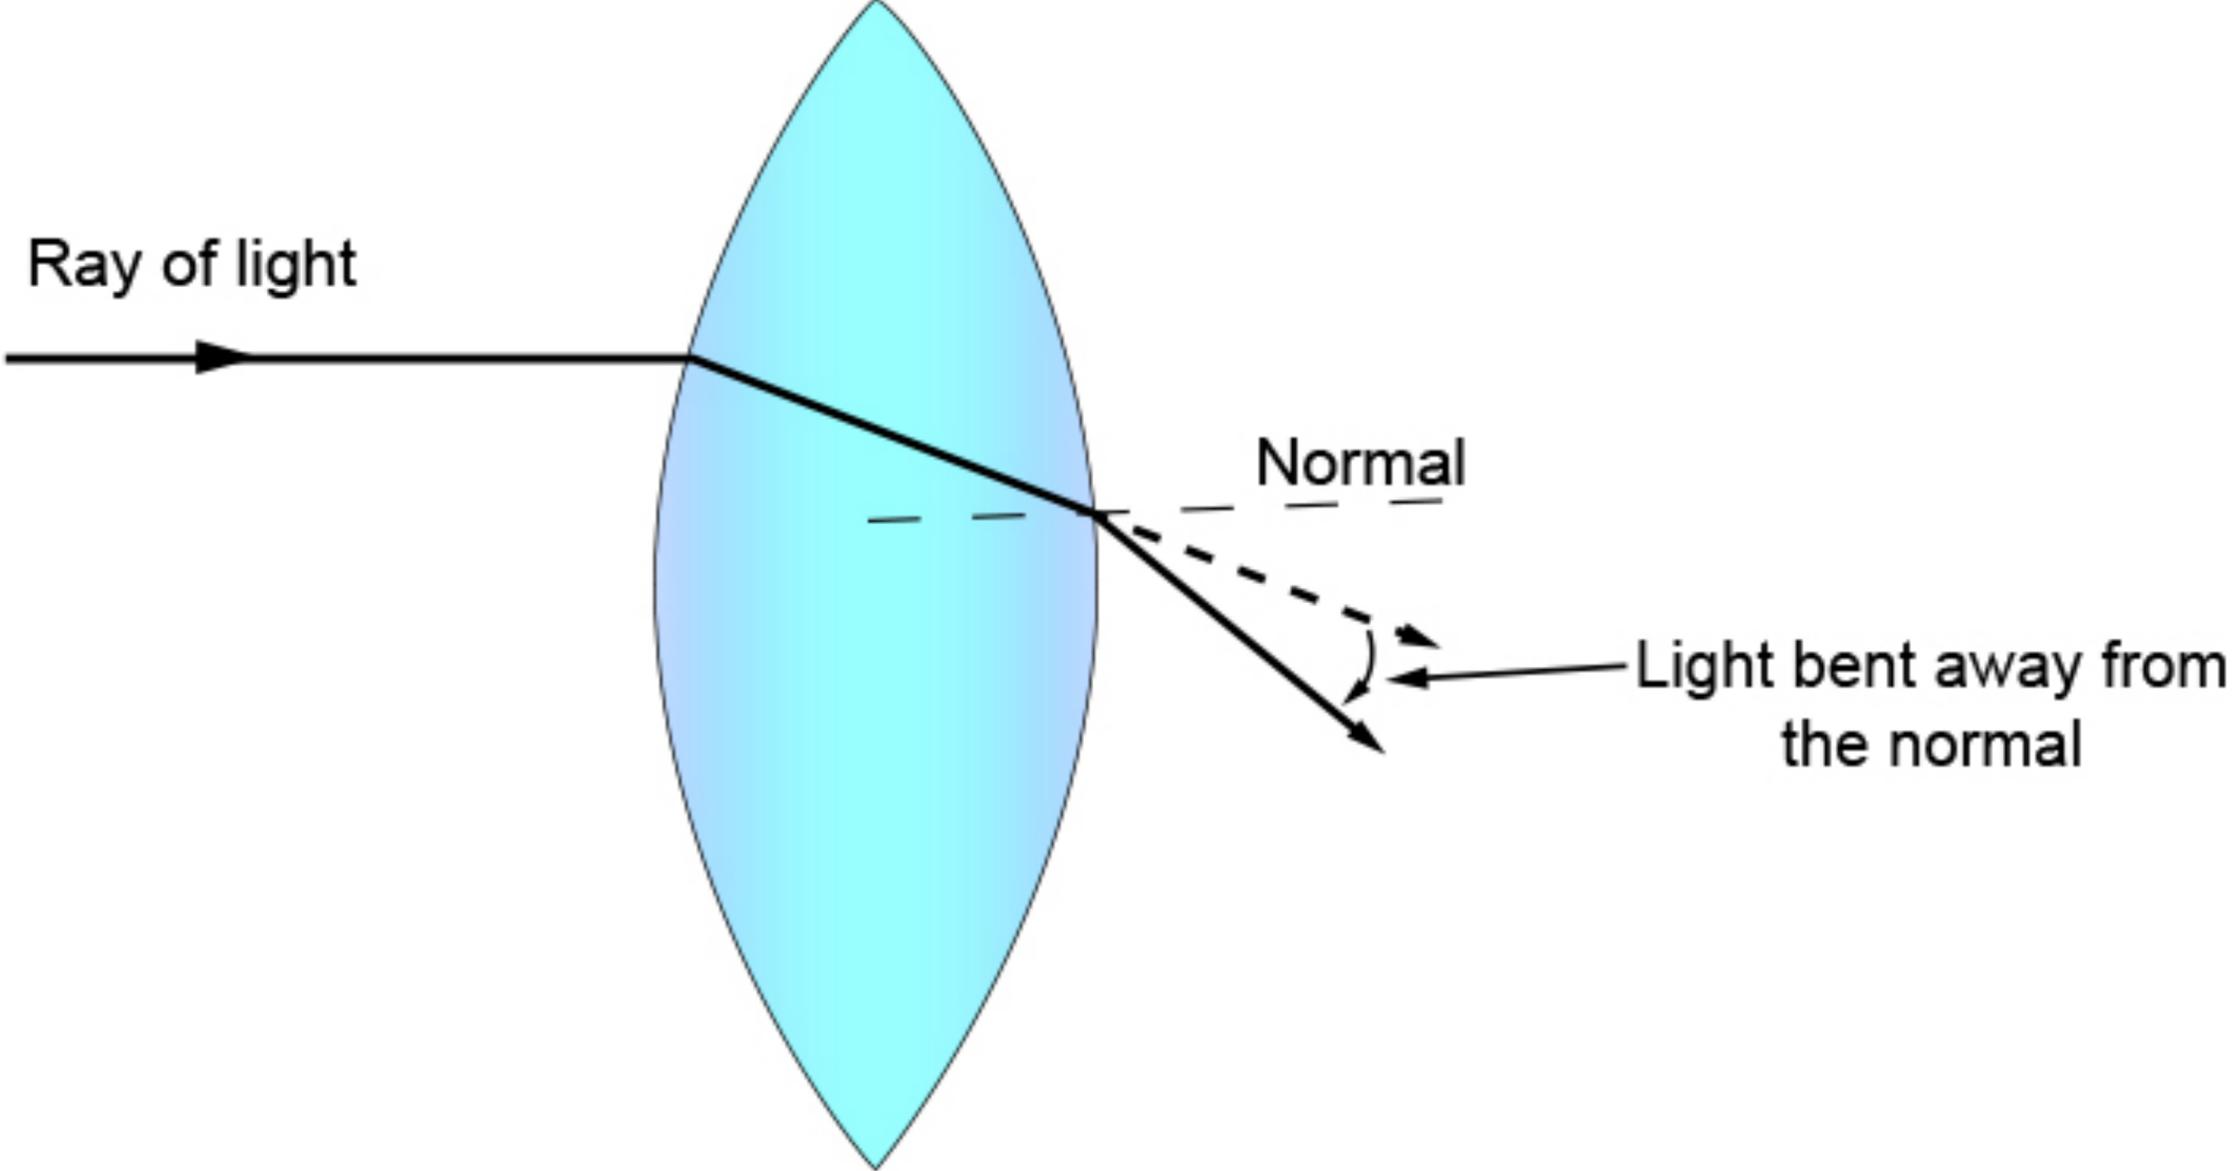

$$n_1 \sin \alpha_1 = n_2 \sin \alpha_2$$

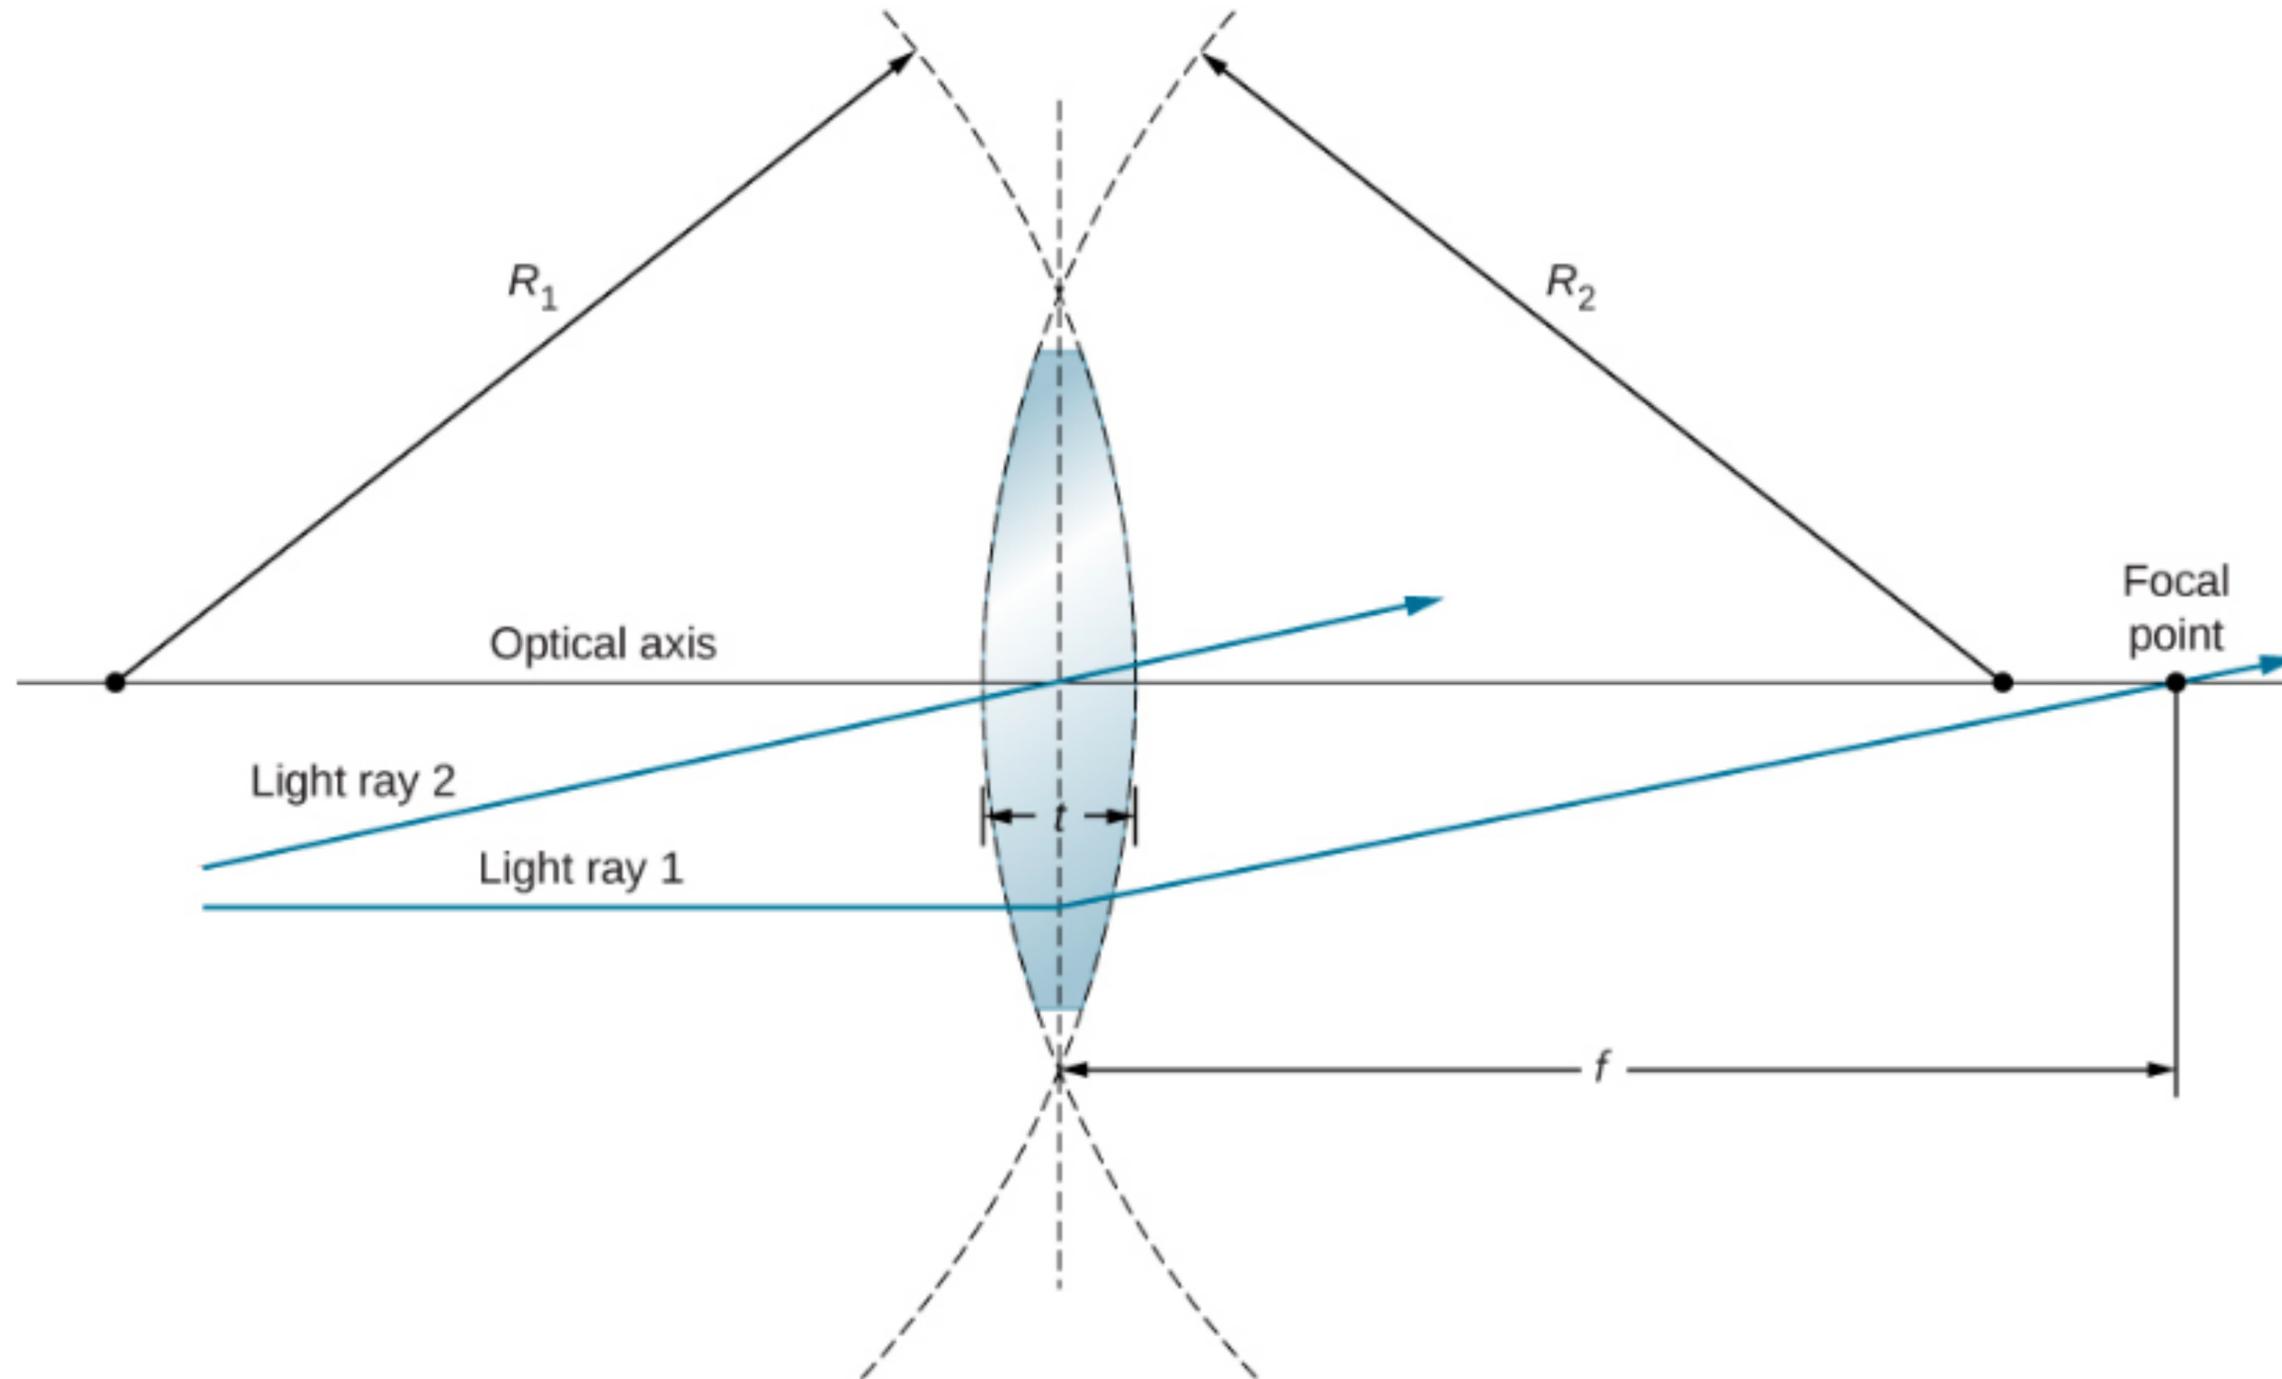

Pinhole Model **with Lens**

General Lens

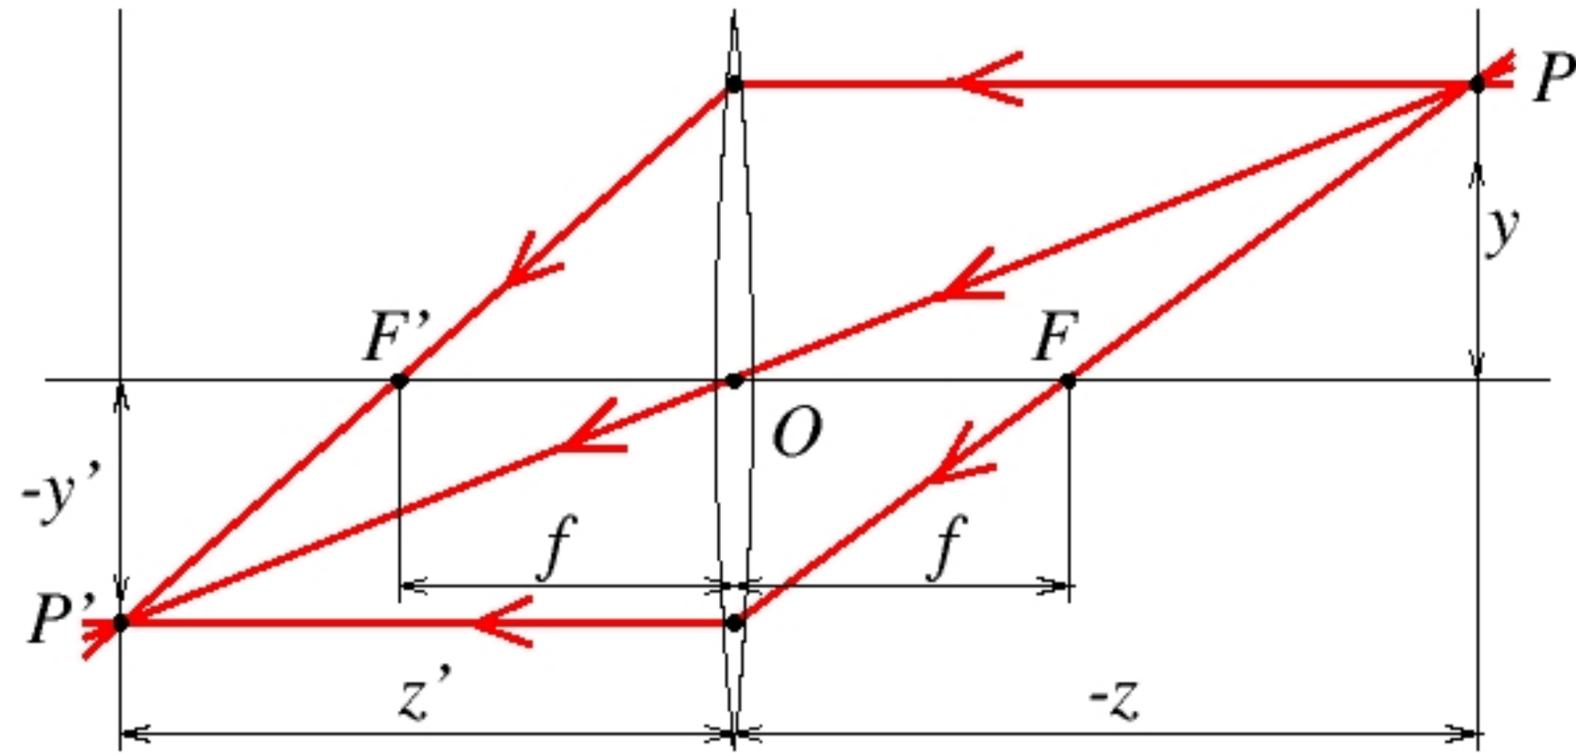

Thin Lens

Thin Lens Equation

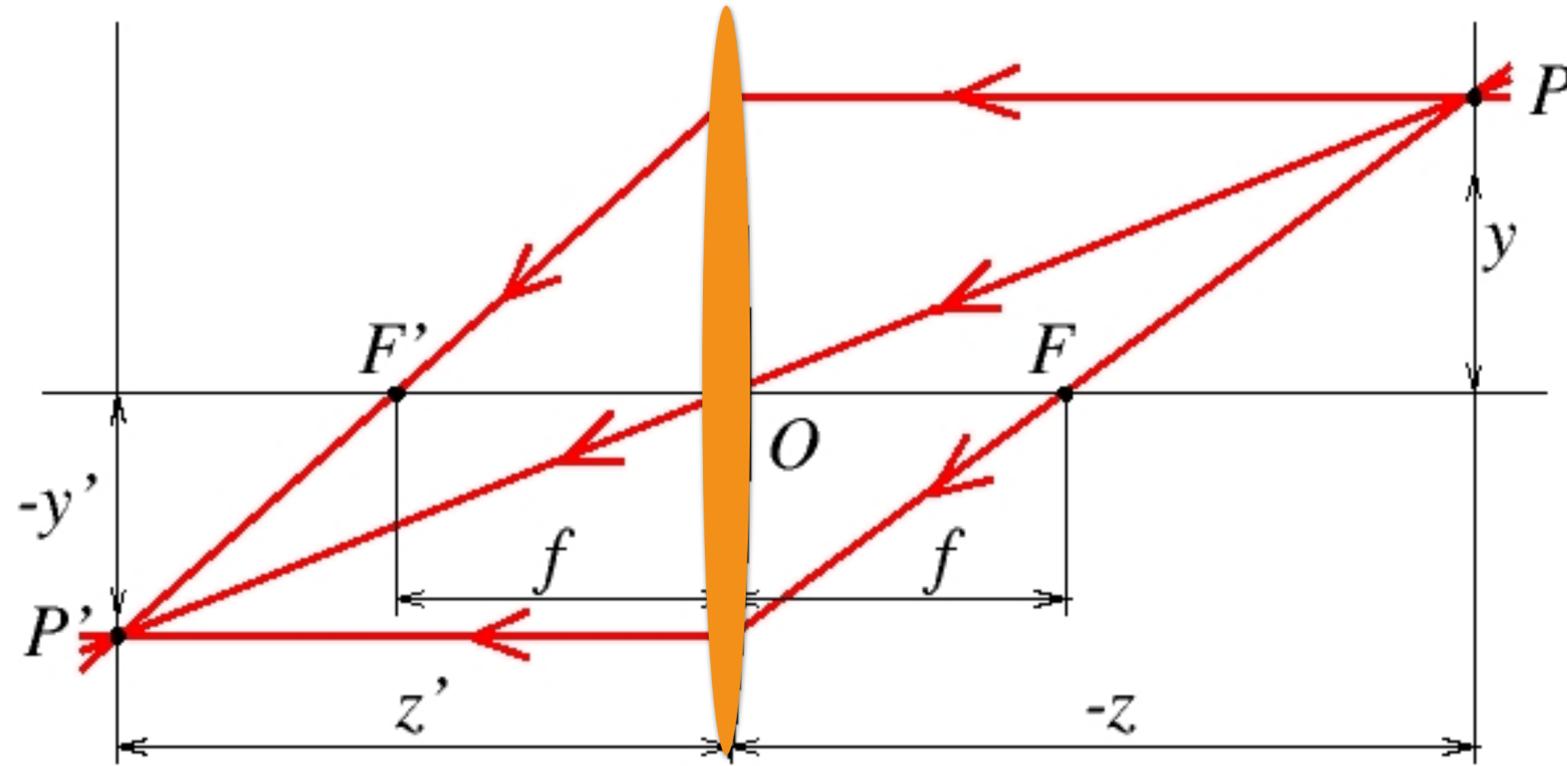

Forsyth & Ponce (1st ed.) Figure 1.9

$$\frac{1}{z'} - \frac{1}{z} = \frac{1}{f}$$

Thin Lens Equation

Focal Length: Property of the lens (geometry and refraction index)

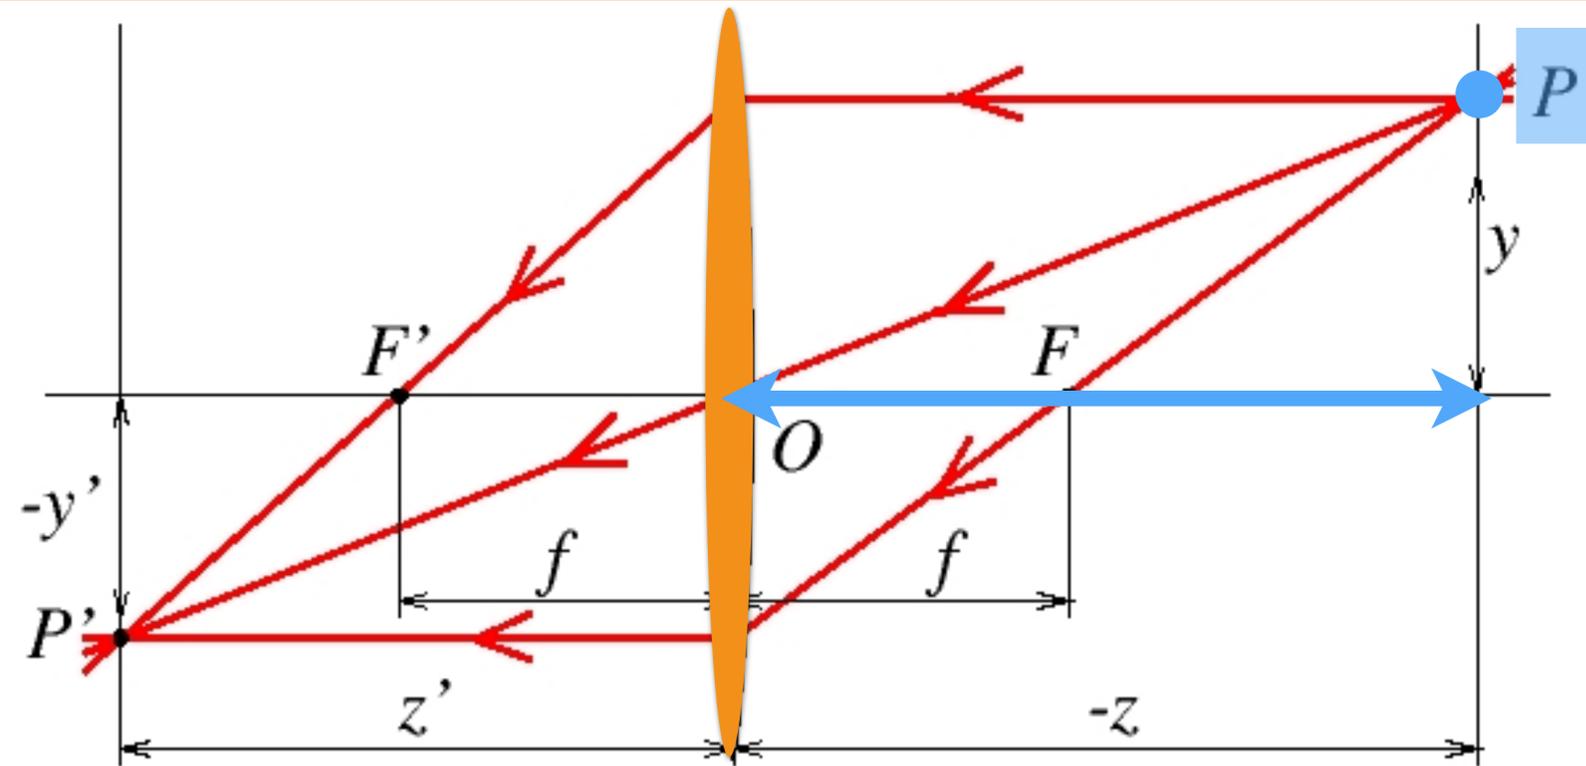

Forsyth & Ponce (1st ed.) Figure 1.9

$$\frac{1}{z'} - \frac{1}{z} = \frac{1}{f}$$

Thin Lens Equation

Focal Length: Property of the lens (geometry and refraction index)

Depth of the point (P) in the world

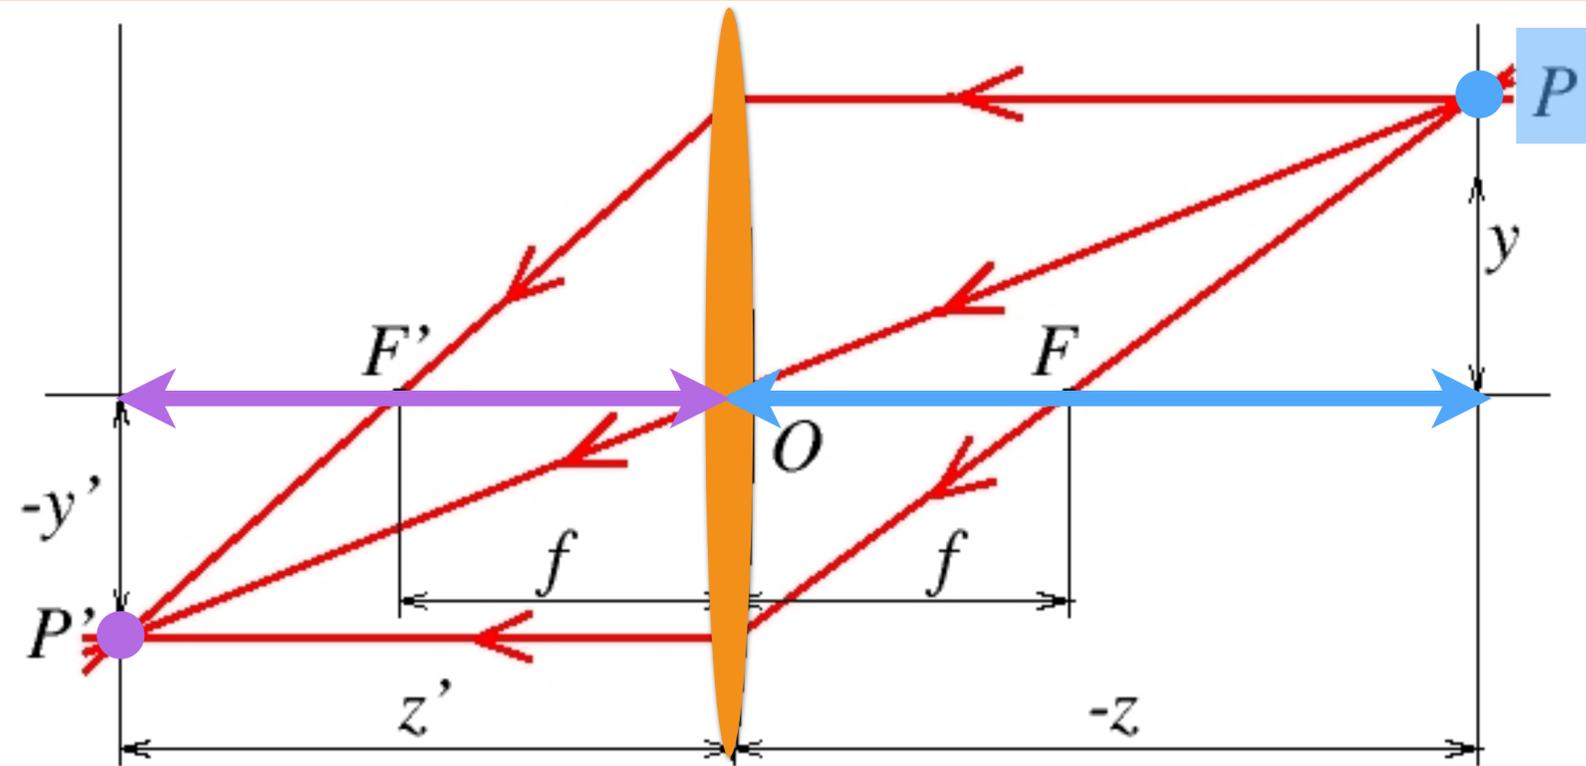

Forsyth & Ponce (1st ed.) Figure 1.9

$$\frac{1}{z'} - \frac{1}{z} = \frac{1}{f}$$

Thin Lens Equation

Focal Length: Property of the lens (geometry and refraction index)

Location of the imaging plane where the projection of this point (P) will be in focus

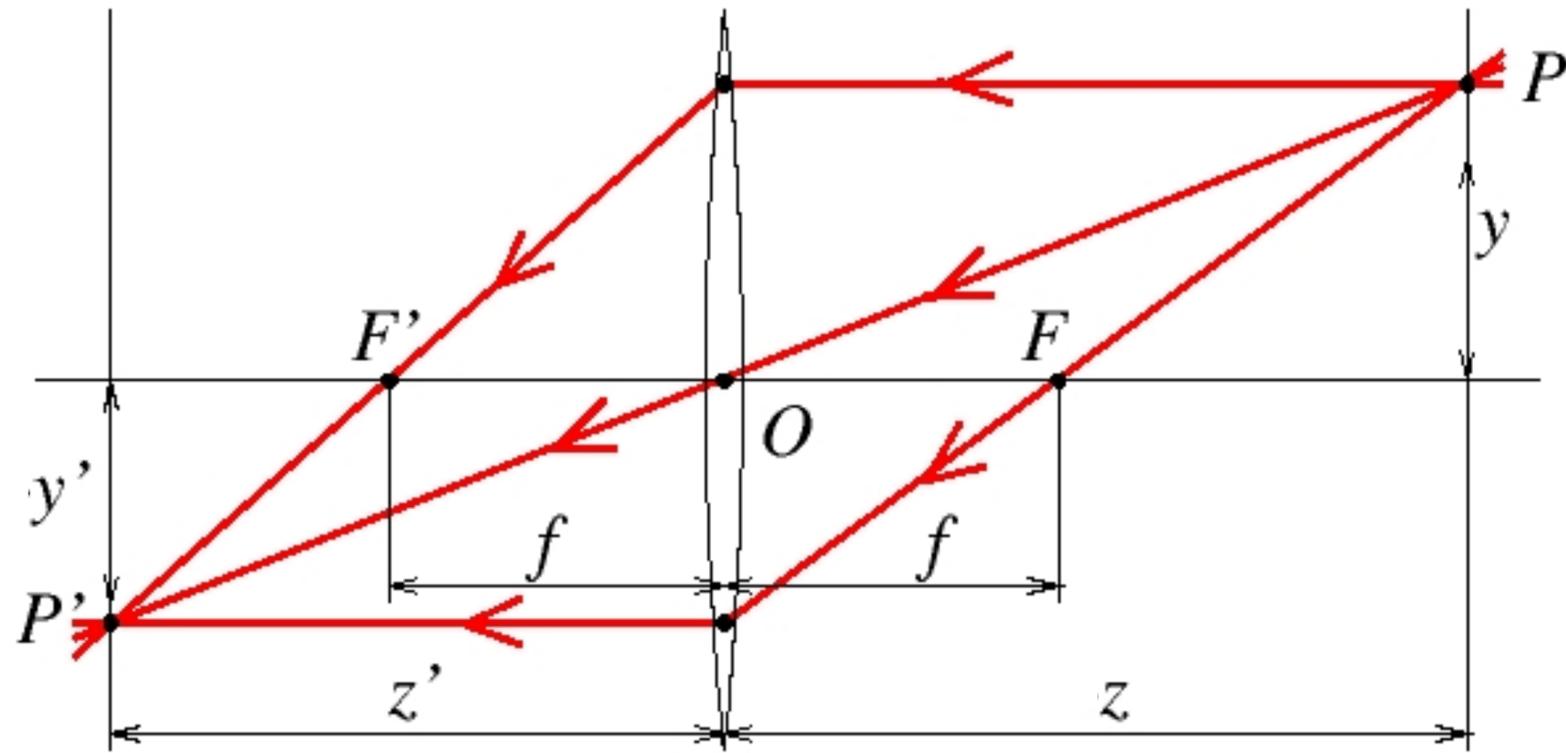

Depth of the point (P) in the world

Forsyth & Ponce (1st ed.) Figure 1.9

$$\frac{1}{z'} - \frac{1}{z} = \frac{1}{f}$$

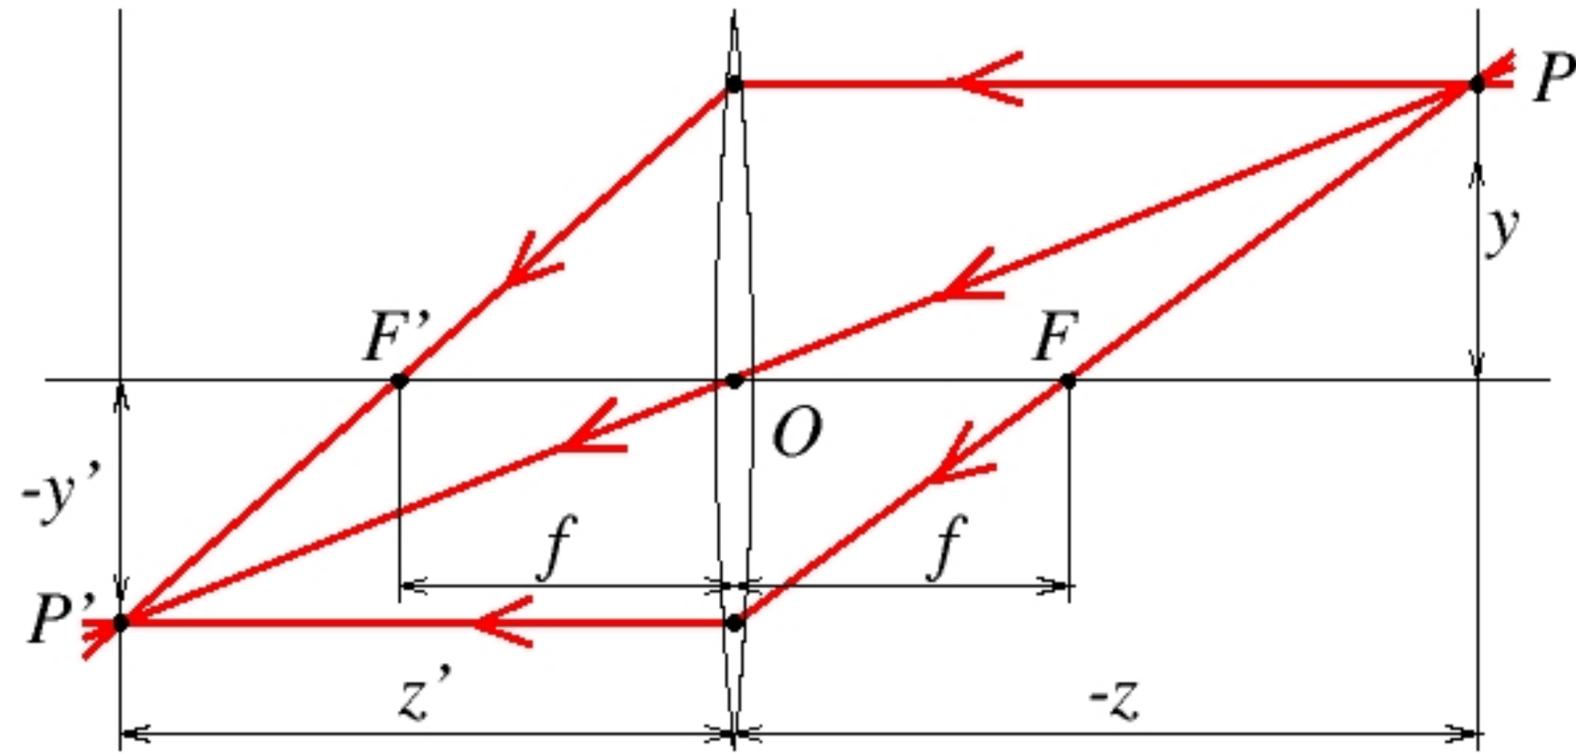

Thin Lens Equation

Forsyth & Ponce (1st ed.) Figure 1.9

$$\frac{1}{z'} + \frac{1}{z} = \frac{1}{f}$$

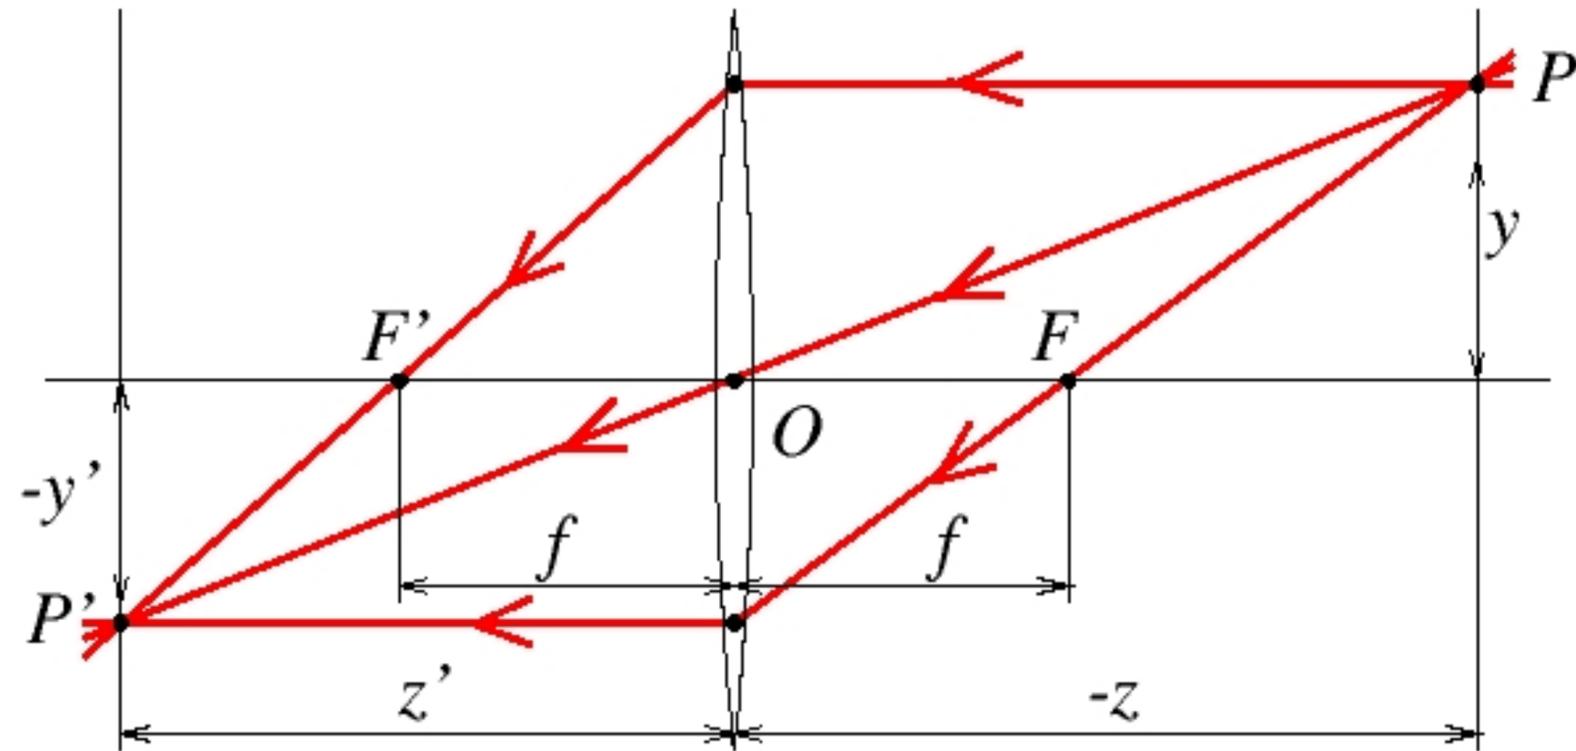

Thin Lens Equation

Forsyth & Ponce (1st ed.) Figure 1.9

$$\frac{1}{z'} - \frac{1}{z} = \frac{1}{f}$$

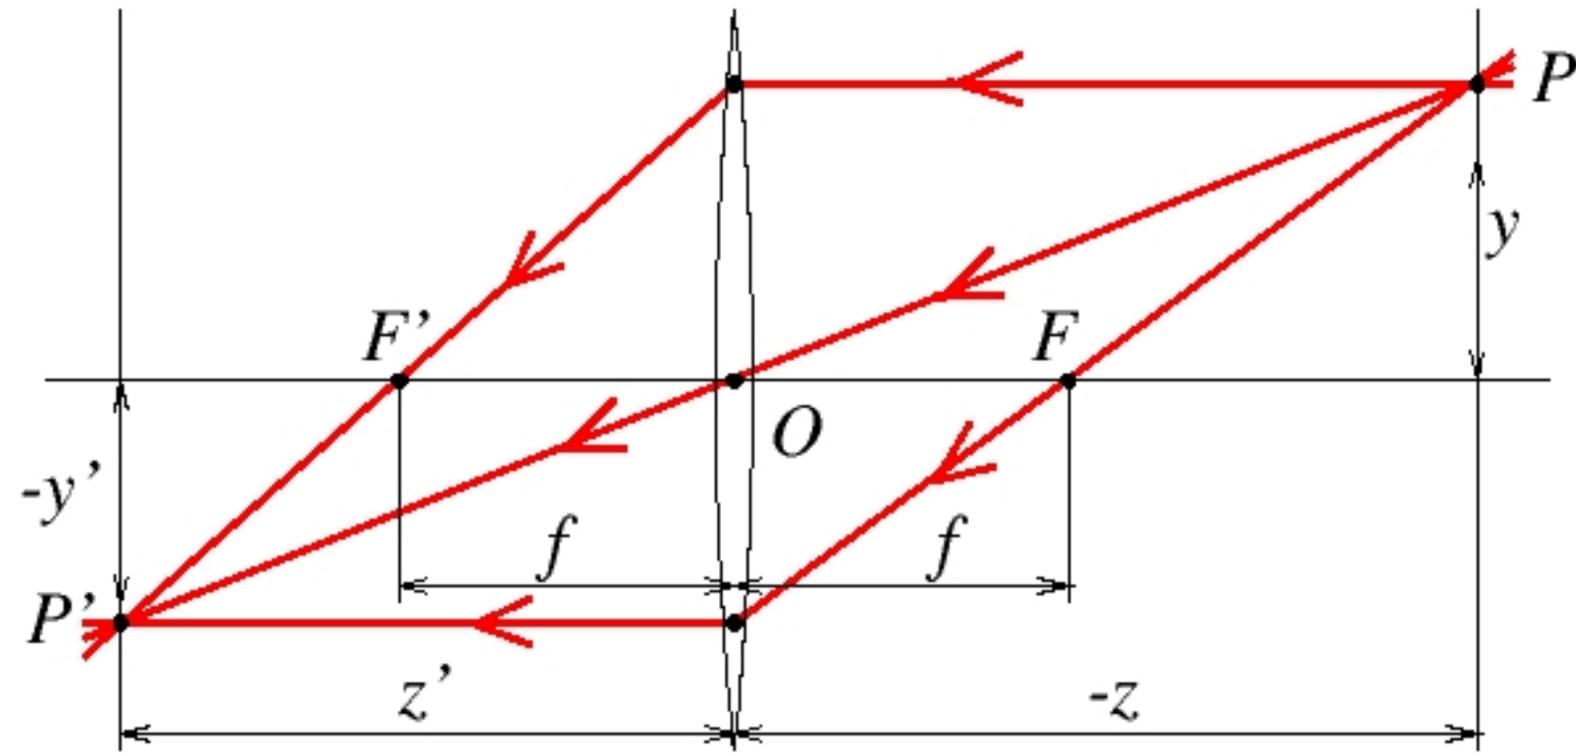

Possible Uses of Thin Lens Abstraction

Forsyth & Ponce (1st ed.) Figure 1.9

$$\frac{1}{z'} - \frac{1}{z} = \frac{1}{f}$$

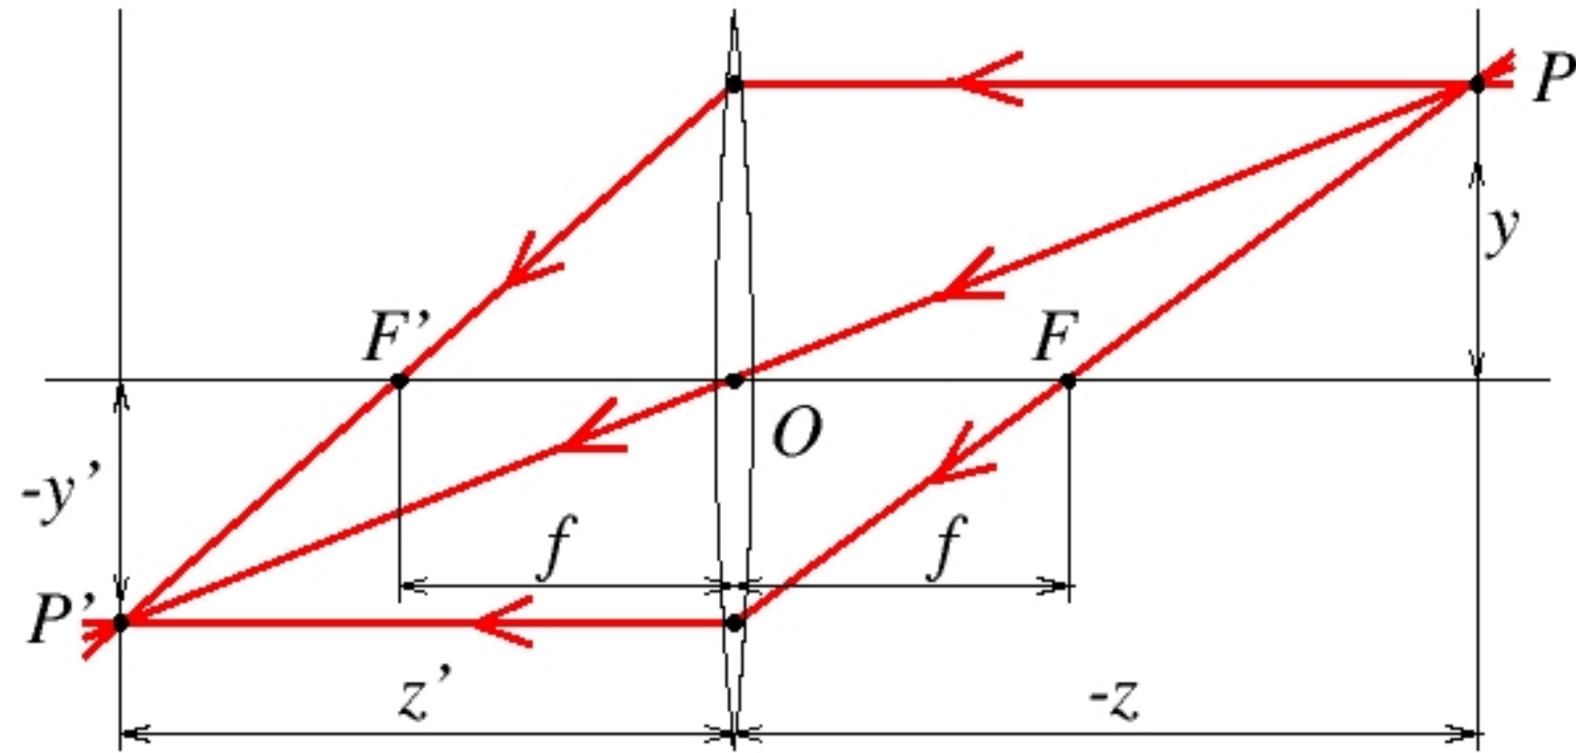

Possible Uses of Thin Lens Abstraction

Forsyth & Ponce (1st ed.) Figure 1.9

$$\frac{1}{z'} - \frac{1}{z} = \frac{1}{f}$$

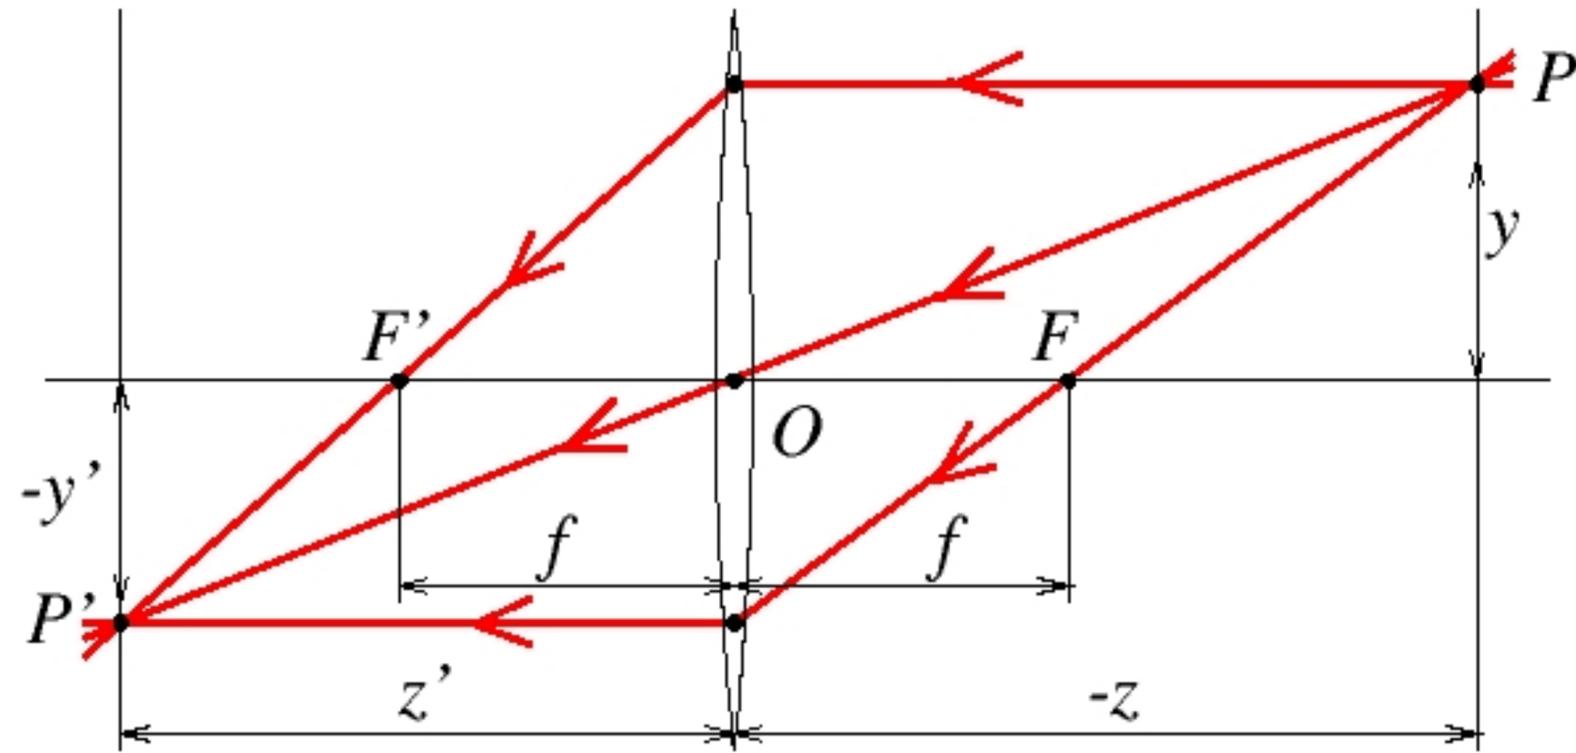

Possible Uses of Thin Lens Abstraction

Forsyth & Ponce (1st ed.) Figure 1.9

$$\frac{1}{z'} - \frac{1}{z} = \frac{1}{f}$$

Possible Uses of Thin Lens Abstraction

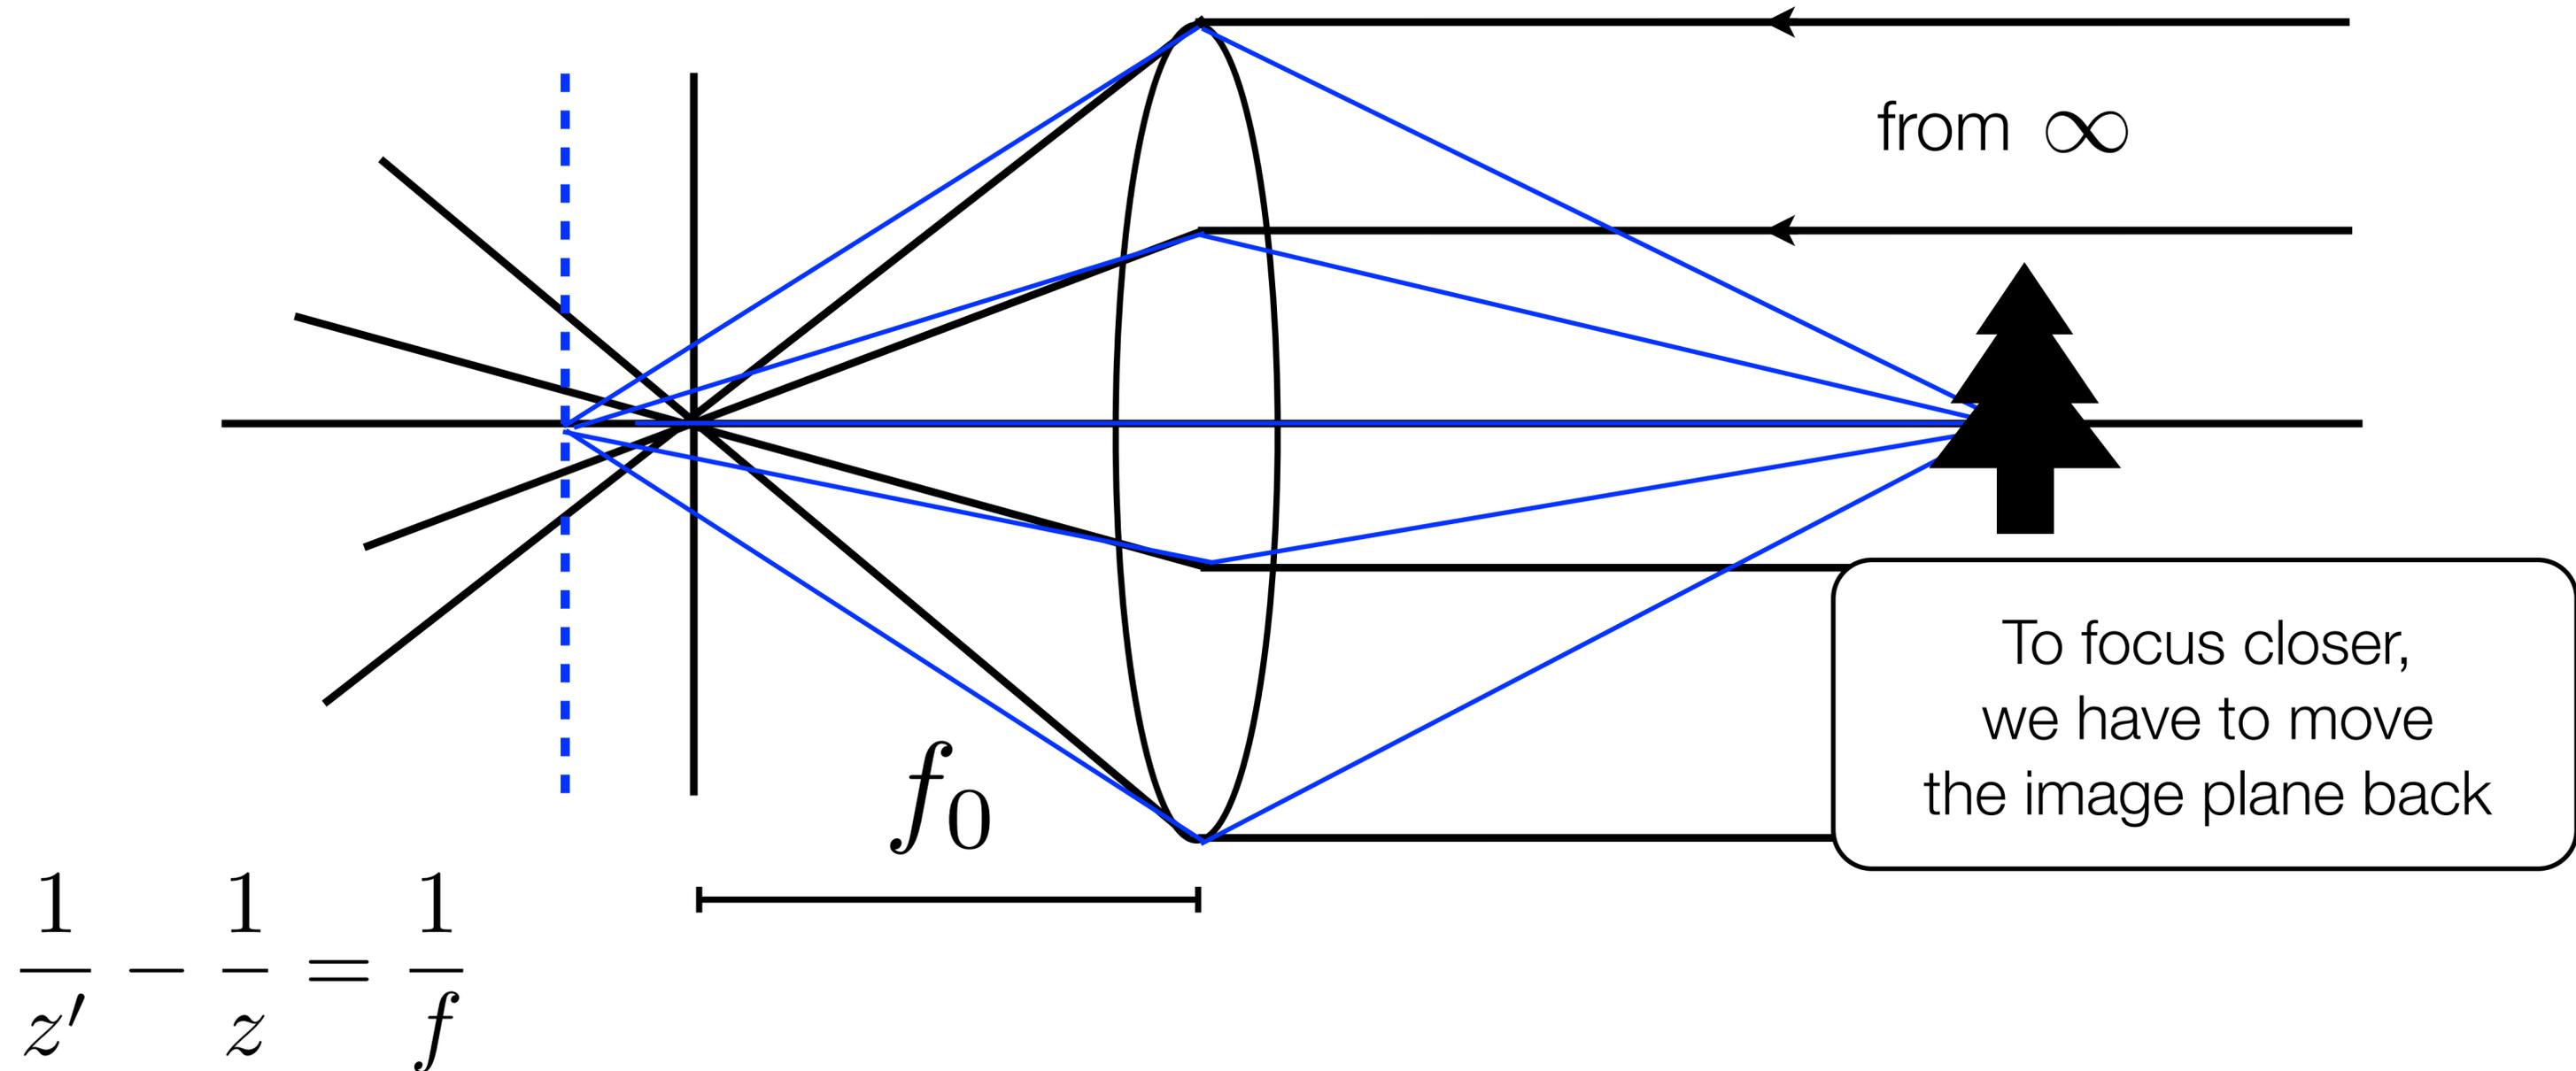

Forsyth & Ponce (1st ed.) Figure 1.9

$$\frac{1}{z'} - \frac{1}{z} = \frac{1}{f}$$

Lens Basics

A lens focuses parallel rays (from points at infinity) at focal length of the lens

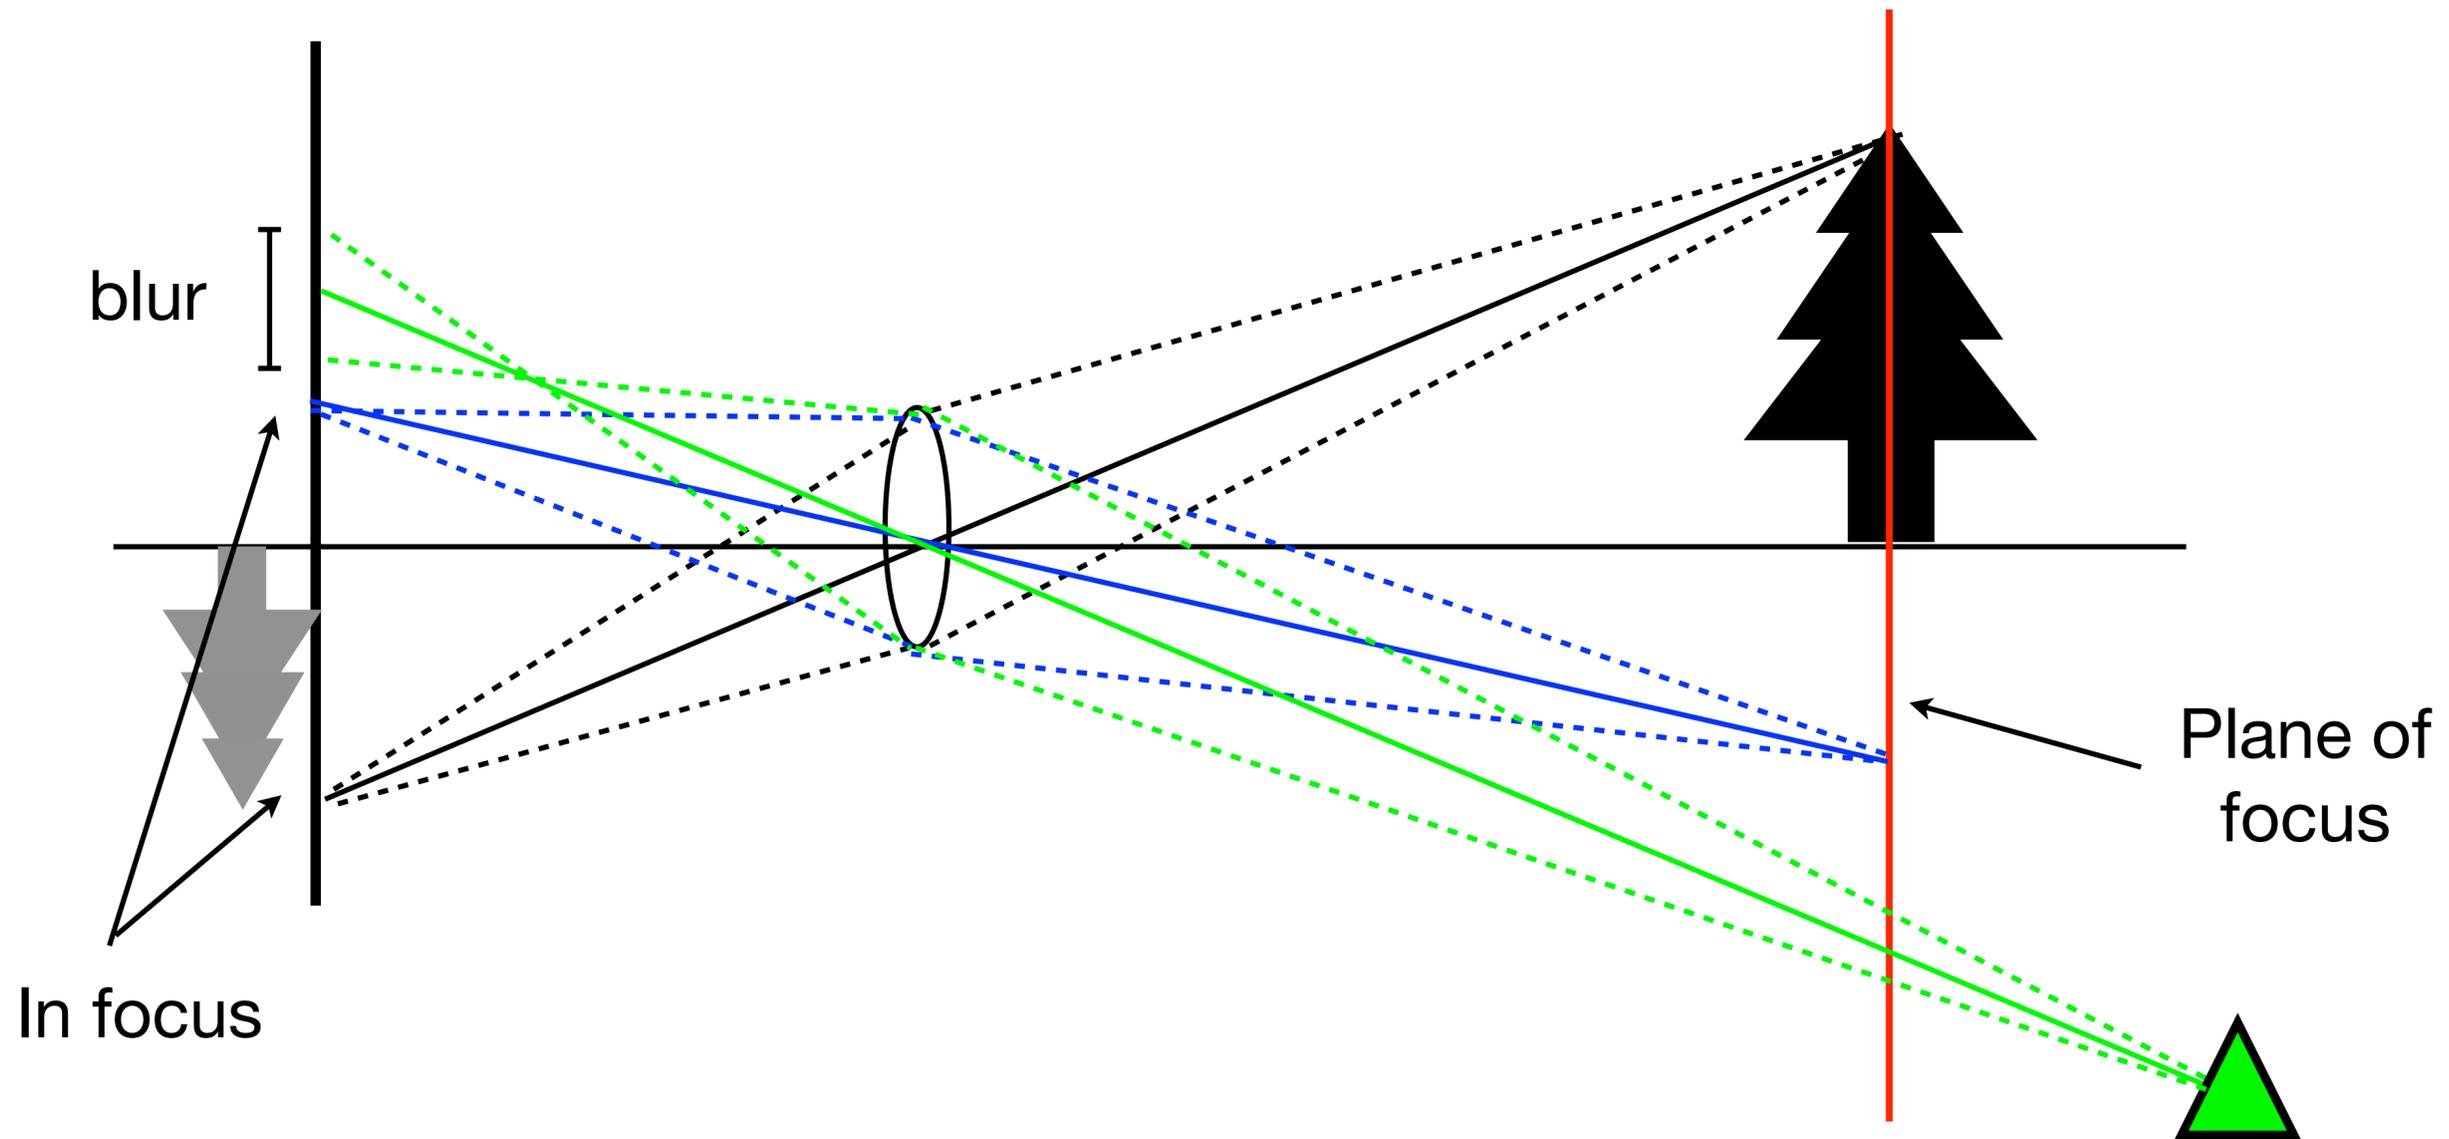

Rays passing through the center of the lens are not bent

Lens Basics

Lenses focus all rays from a (parallel to lens) plane in the world

$$\frac{1}{z'} - \frac{1}{z} = \frac{1}{f}$$

Objects off the plane are blurred depending on the distance

Pinhole Camera with a Lens

Perspective Projection: location in the image where a 3D world point projects

$$\begin{aligned}x' &= f' \frac{x}{z} \\y' &= f' \frac{y}{z}\end{aligned}$$

Thin Lens Equation: depth of the imaging plane itself where this point will be in focus

$$\frac{1}{z'} - \frac{1}{z} = \frac{1}{f}$$

Perspective Projection + Thin Lens Examples

Where would the focusing plane be for various positions of the object?

$$\frac{1}{z'} - \frac{1}{z} = \frac{1}{f}$$

Perspective Projection + Thin Lens Examples

Where would the focusing plane be for various positions of the object?

$$\frac{1}{z'} - \frac{1}{z} = \frac{1}{f}$$

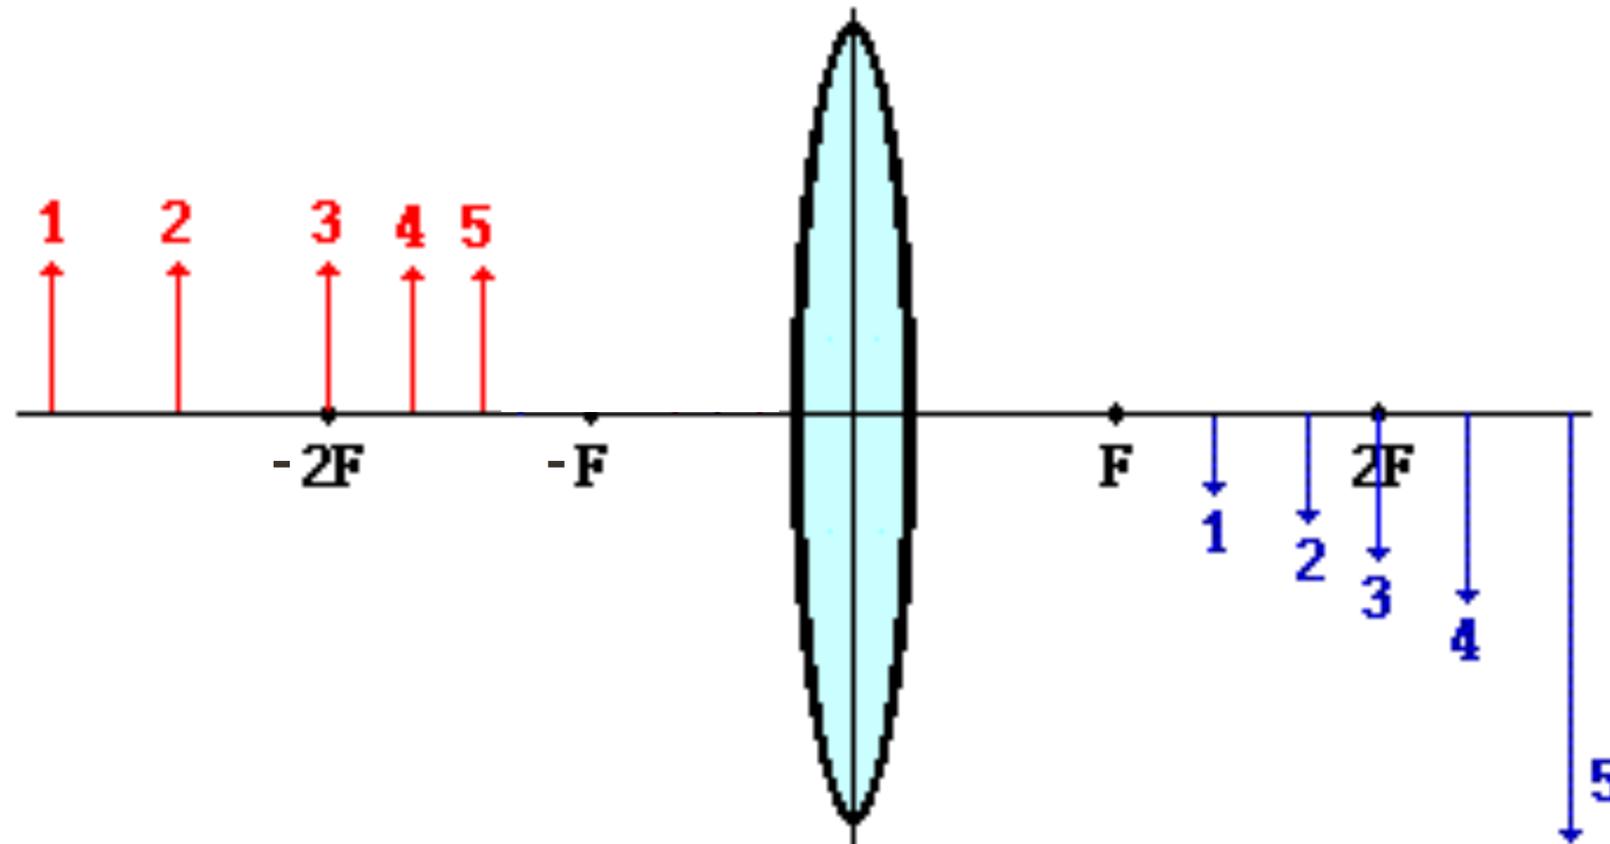

$$z' = \frac{zf}{z + f}$$

Perspective Projection + Thin Lens Examples

Where would the focusing plane be for various positions of the object?

$$\frac{1}{z'} - \frac{1}{z} = \frac{1}{f}$$

$$z' = \frac{zf}{z + f}$$

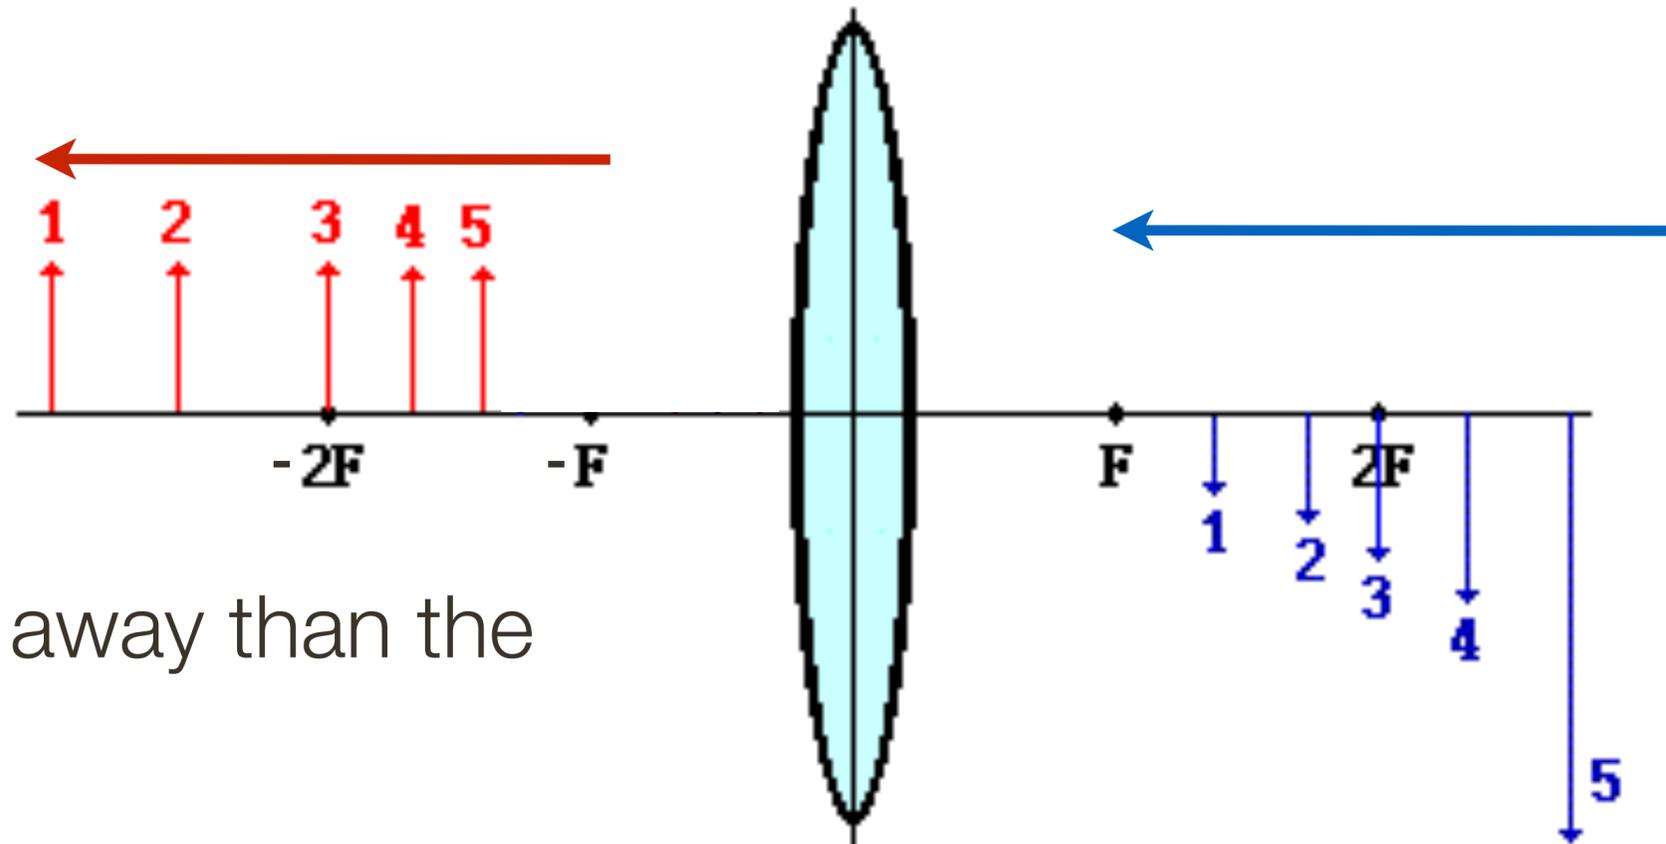

Perspective Projection + Thin Lens Examples

Where would the focusing plane be for various positions of the object?

$$\frac{1}{z'} - \frac{1}{z} = \frac{1}{f}$$

$$z' = \frac{zf}{z + f}$$

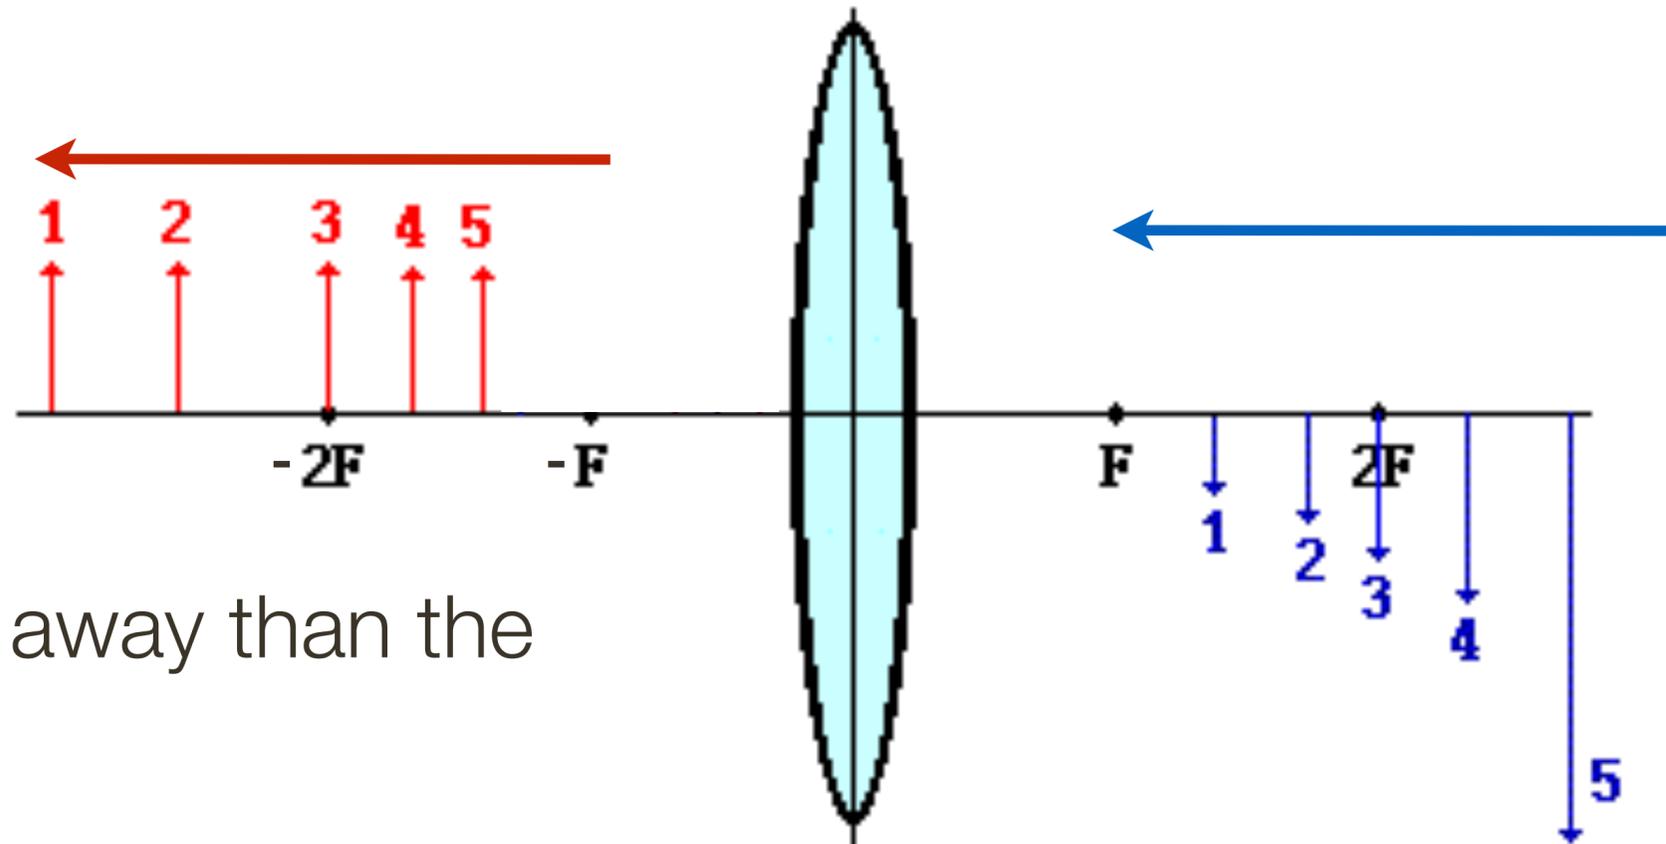

Objects **further** away than the **focal length**

Perspective Projection + Thin Lens Examples

Where would the focusing plane be for various positions of the object?

$$\frac{1}{z'} - \frac{1}{z} = \frac{1}{f}$$

$$z' = \frac{zf}{z + f}$$

$$\lim_{z \rightarrow -\infty} \frac{zf}{z + f} = f$$

L'Hopital's Rule

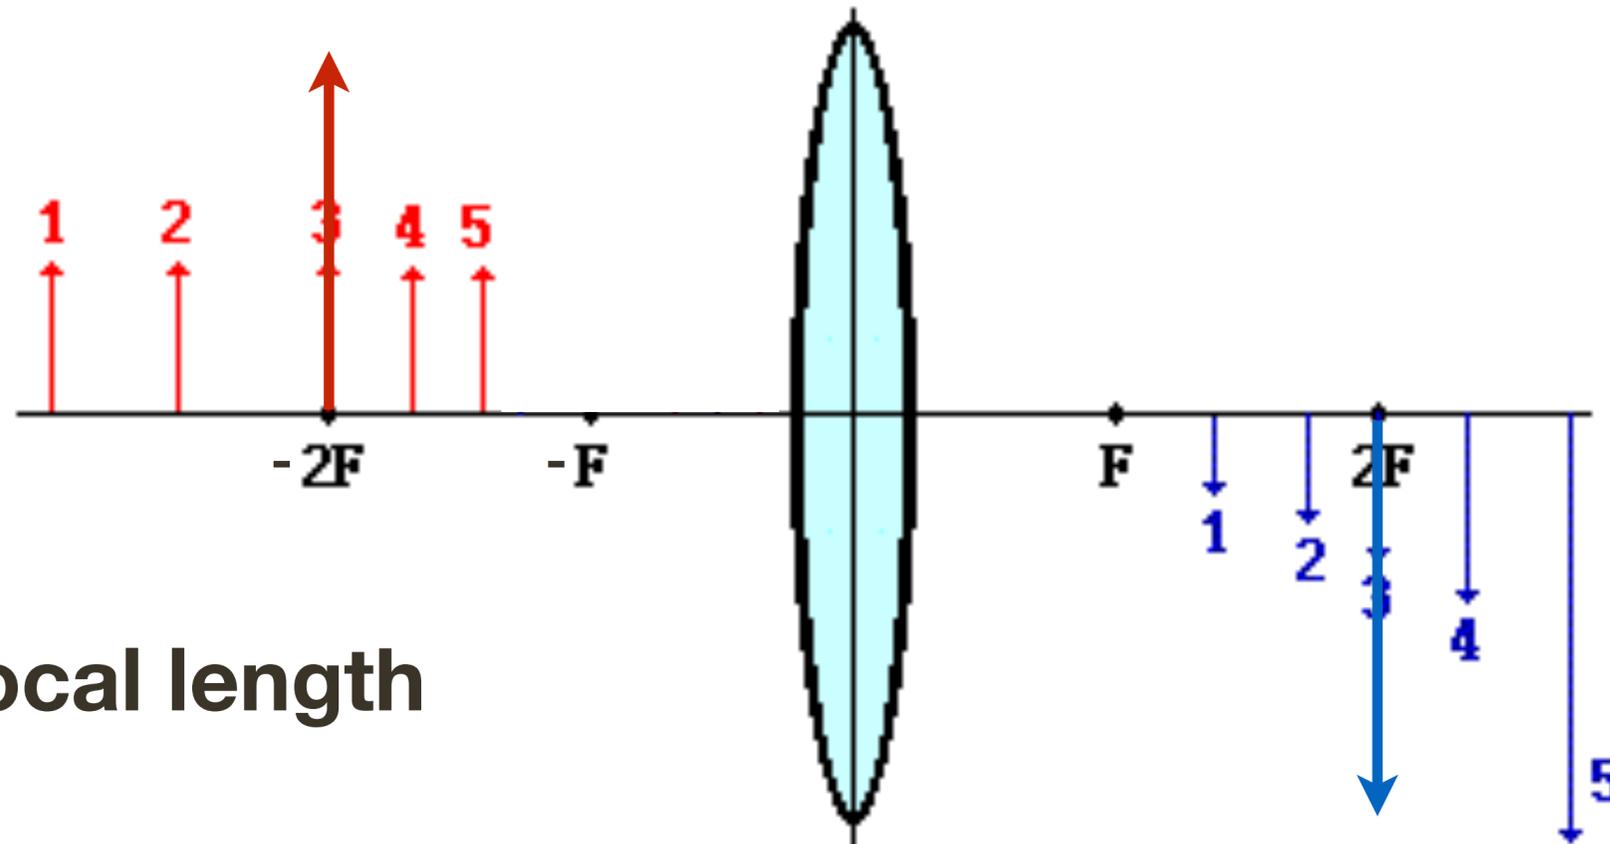

Objects **further** away than the **focal length**

Perspective Projection + Thin Lens Examples

Where would the focusing plane be for various positions of the object?

$$\frac{1}{z'} - \frac{1}{z} = \frac{1}{f}$$

$$z' = \frac{zf}{z + f}$$

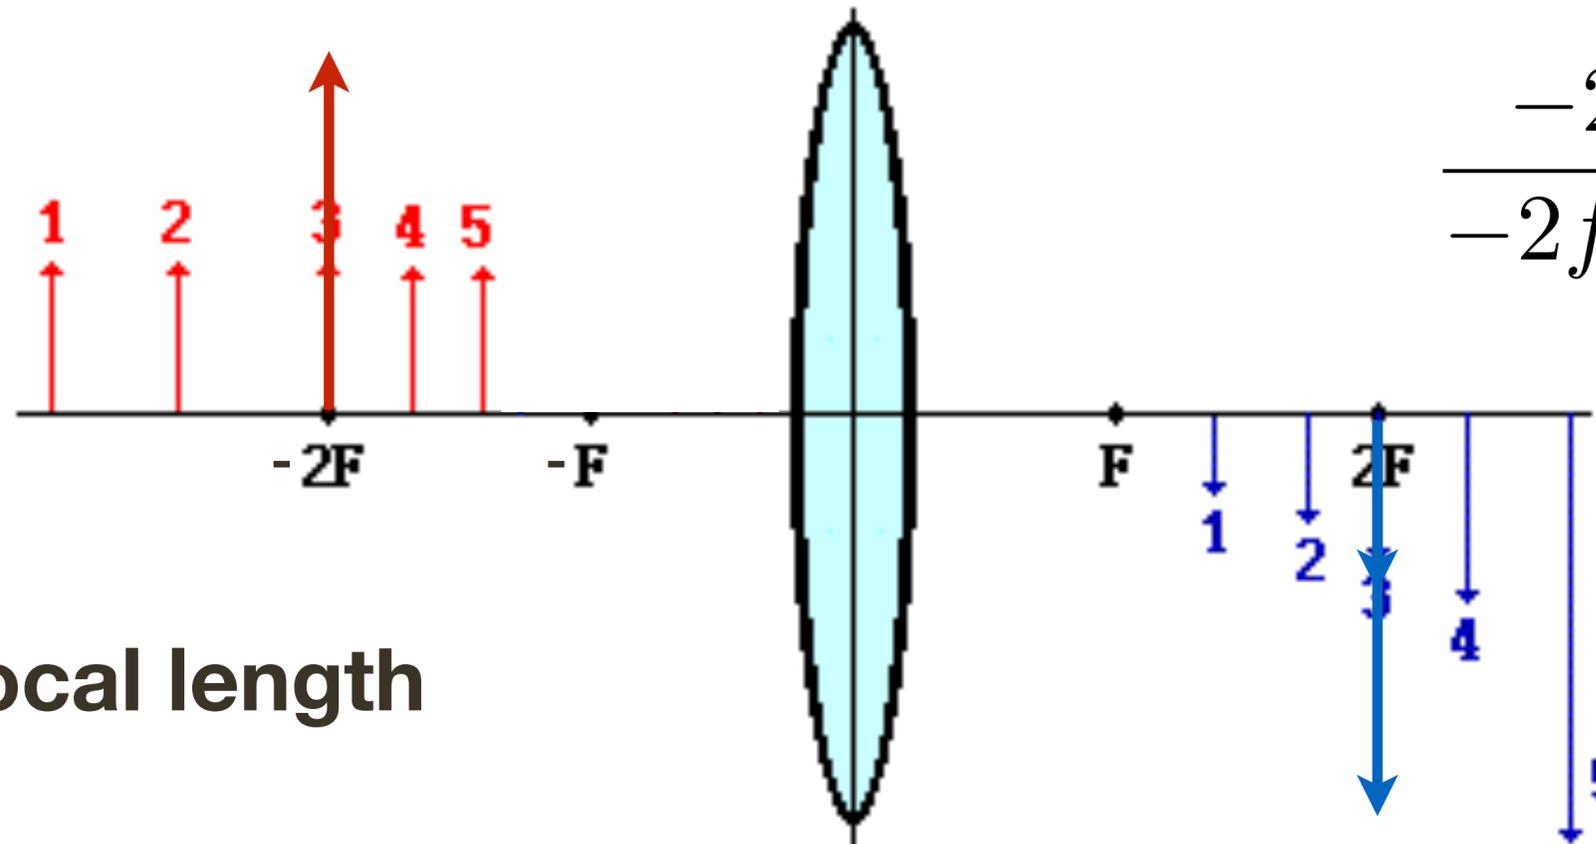

Objects at 2 x **focal length**

Perspective Projection + Thin Lens Examples

Where would the focusing plane be for various positions of the object?

$$\frac{1}{z'} - \frac{1}{z} = \frac{1}{f}$$

$$z' = \frac{zf}{z + f}$$

$$\frac{-2f^2}{-2f + f} = \frac{-2f^2}{-f} = 2f$$

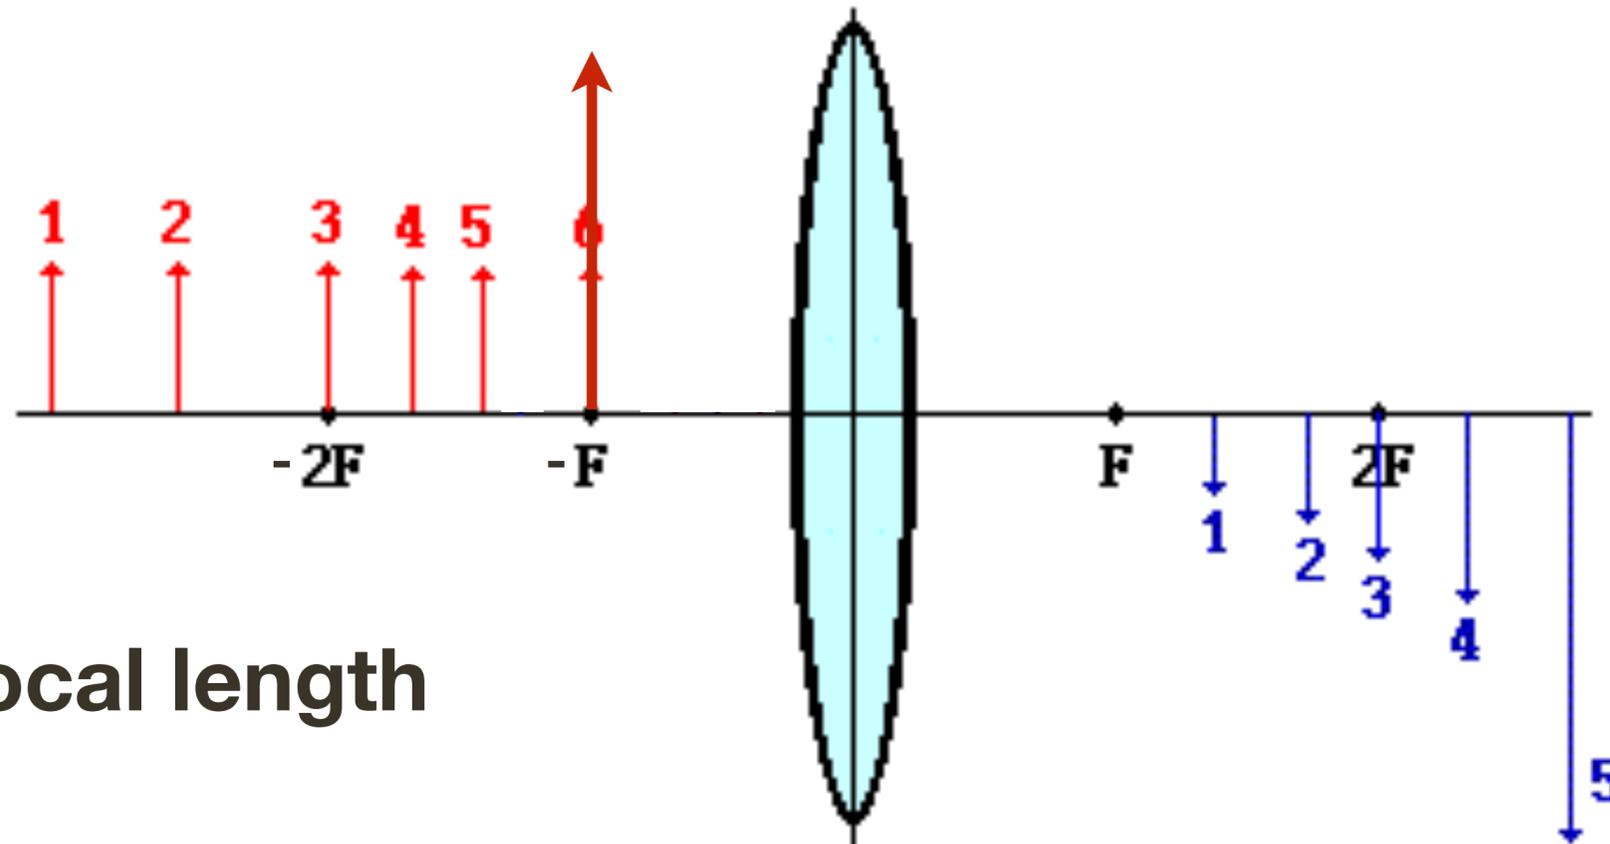

Objects at 2 x **focal length**

Perspective Projection + Thin Lens Examples

Where would the focusing plane be for various positions of the object?

$$\frac{1}{z'} - \frac{1}{z} = \frac{1}{f}$$

$$z' = \frac{zf}{z + f}$$

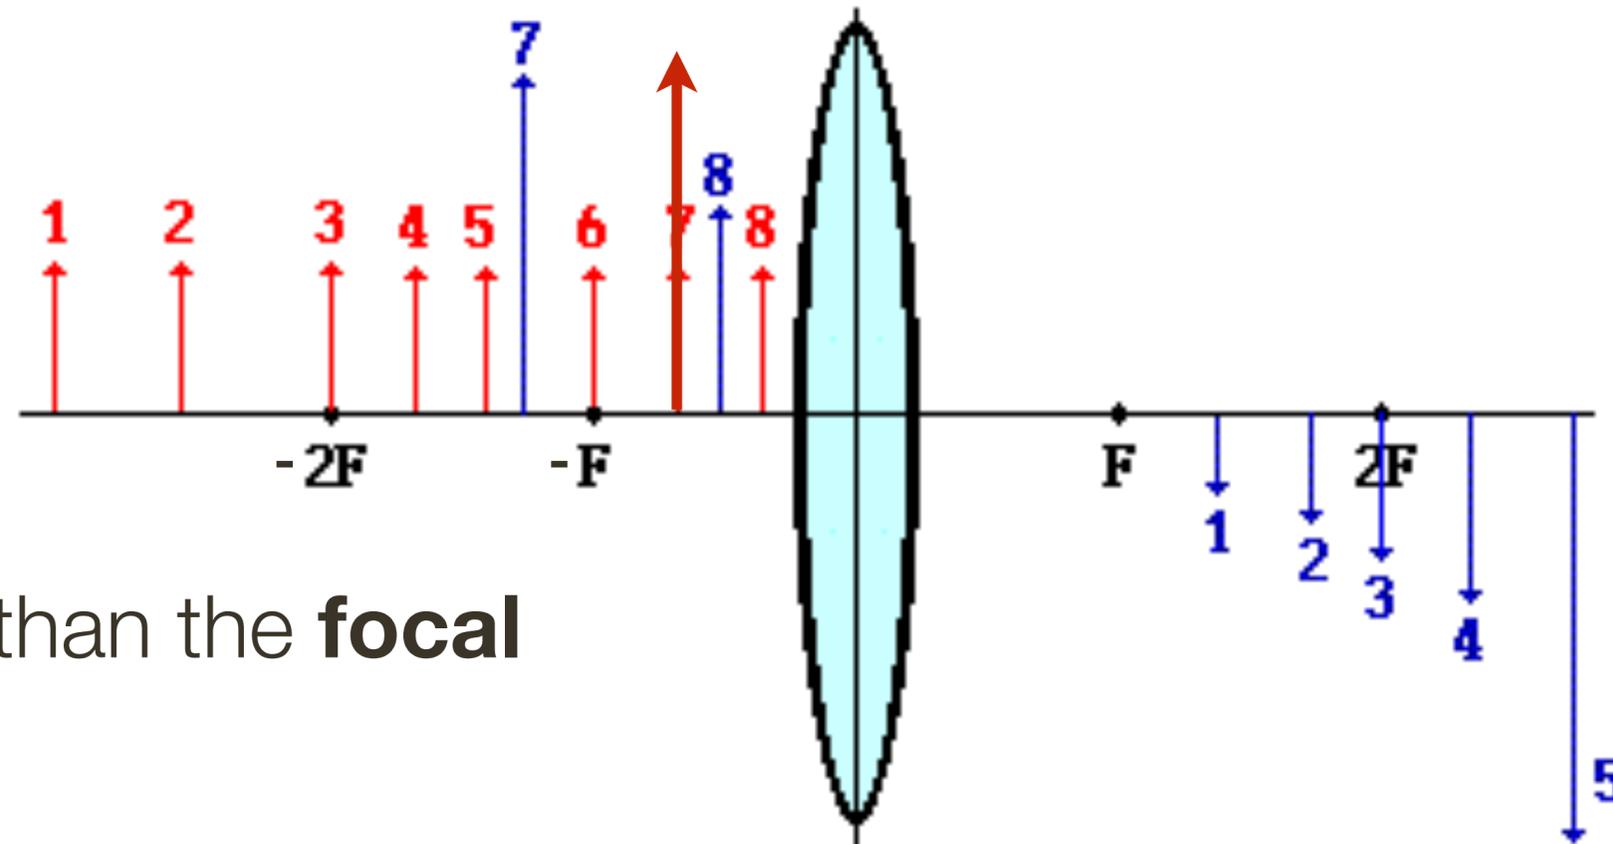

Objects at the **focal length**

Perspective Projection + Thin Lens Examples

Where would the focusing plane be for various positions of the object?

$$\frac{1}{z'} - \frac{1}{z} = \frac{1}{f}$$

$$z' = \frac{zf}{z + f}$$

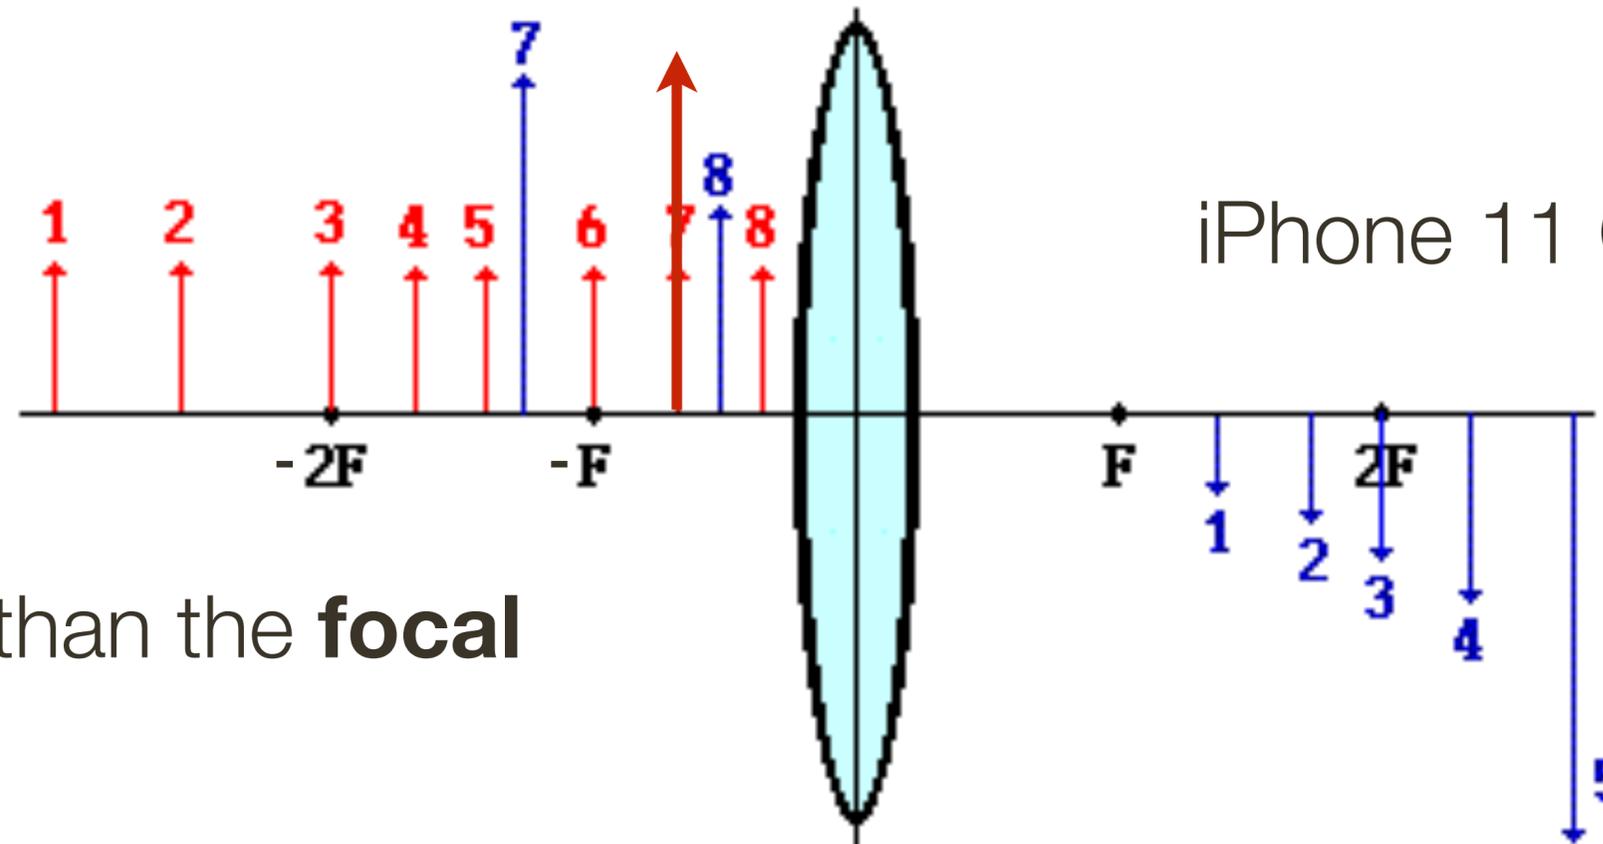

Objects **closer** than the **focal length**

Perspective Projection + Thin Lens Examples

Where would the focusing plane be for various positions of the object?

$$\frac{1}{z'} - \frac{1}{z} = \frac{1}{f}$$

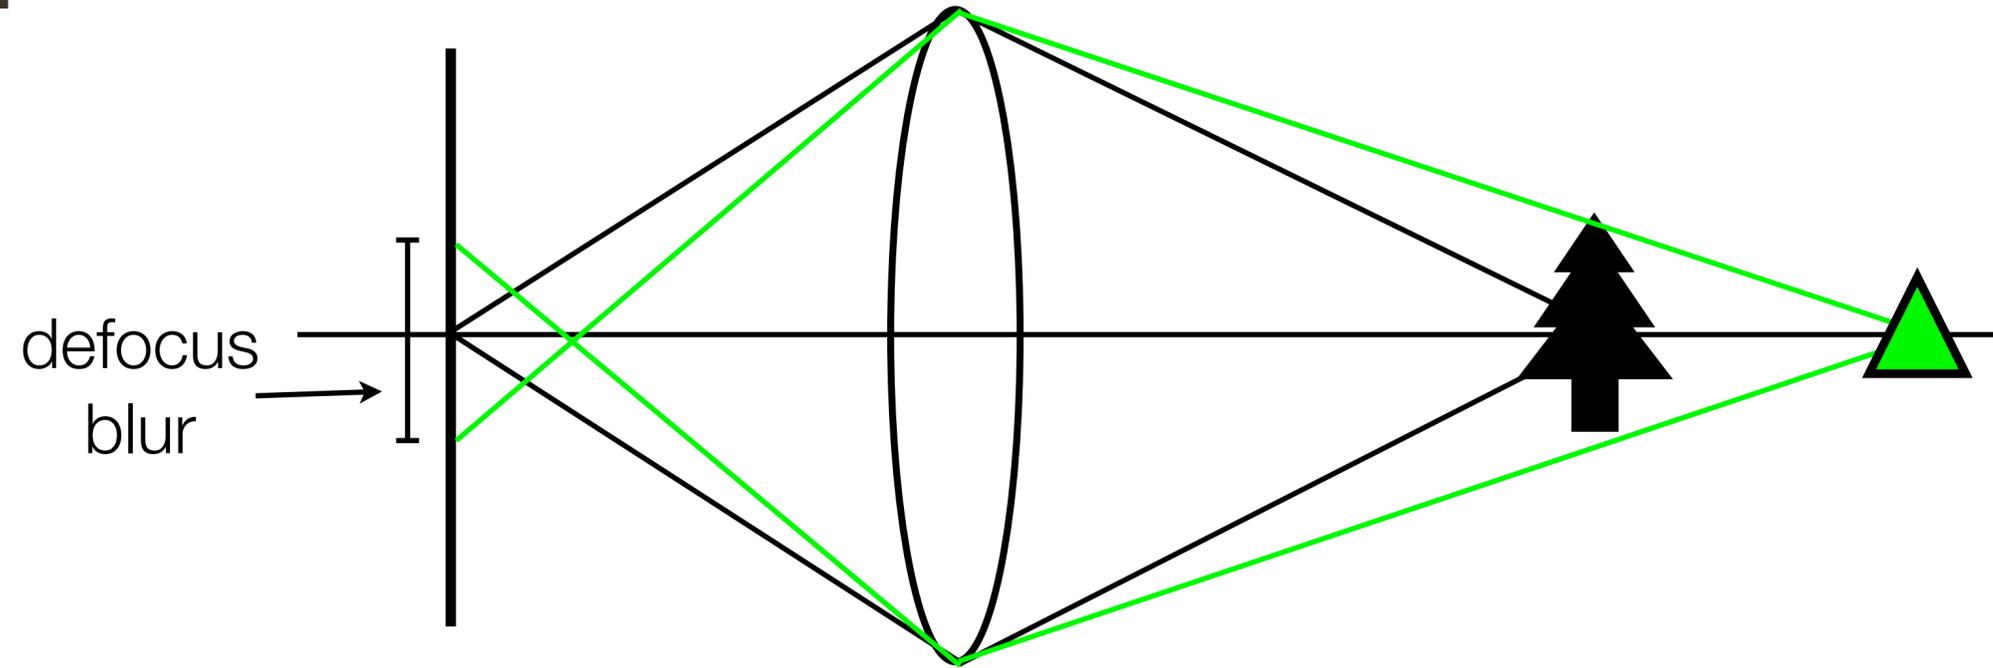

$$z' = \frac{zf}{z + f}$$

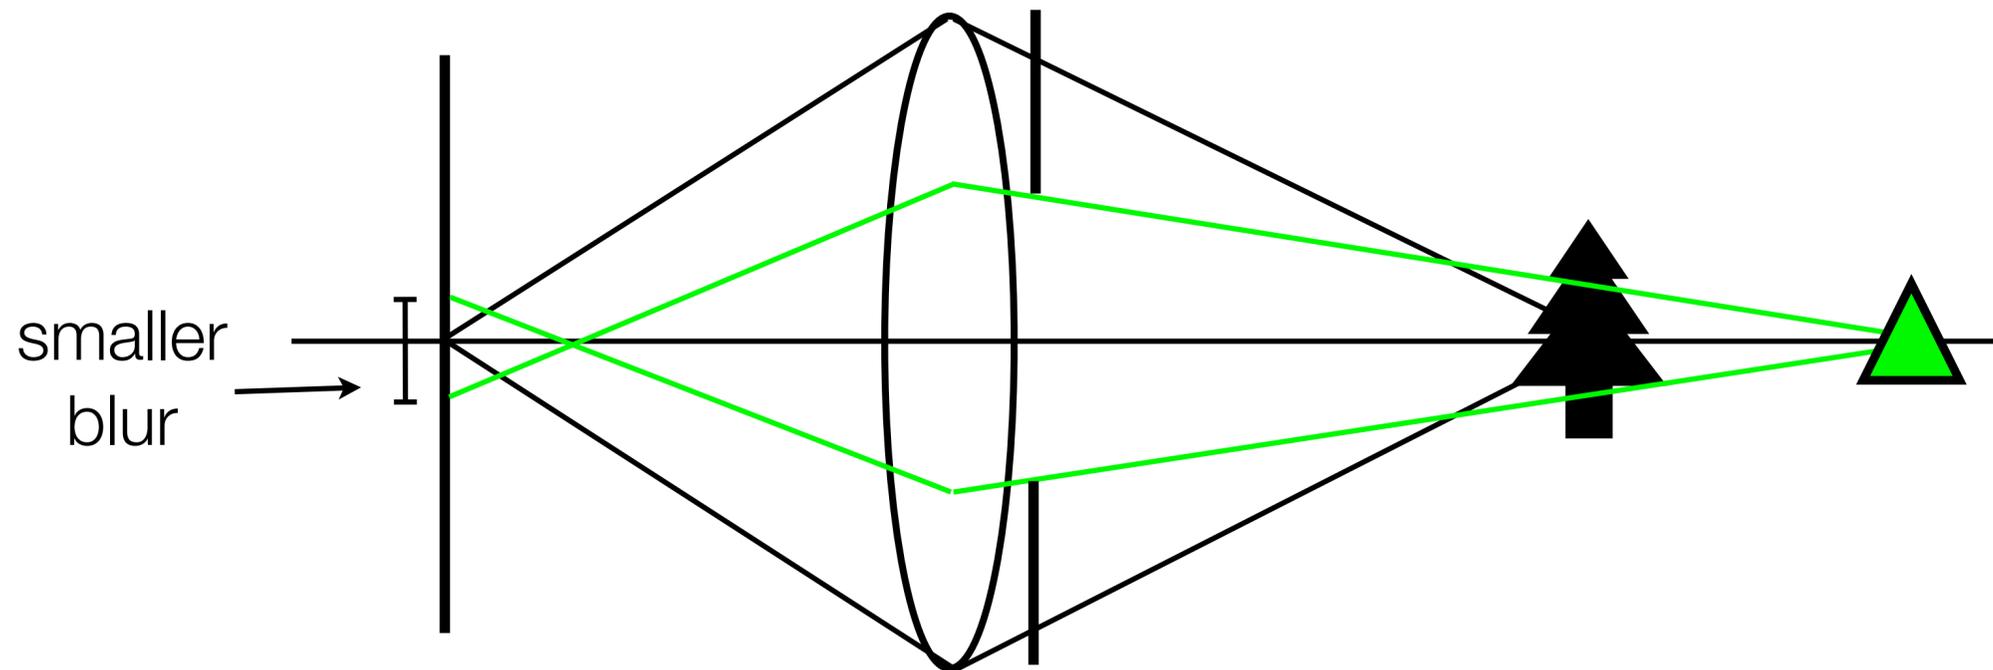

iPhone 11 Camera Lens: **26mm**

Objects **closer** than the **focal length**

Effect of **Aperture** Size

Smaller aperture \Rightarrow smaller blur, larger **depth of field**

Depth of Field

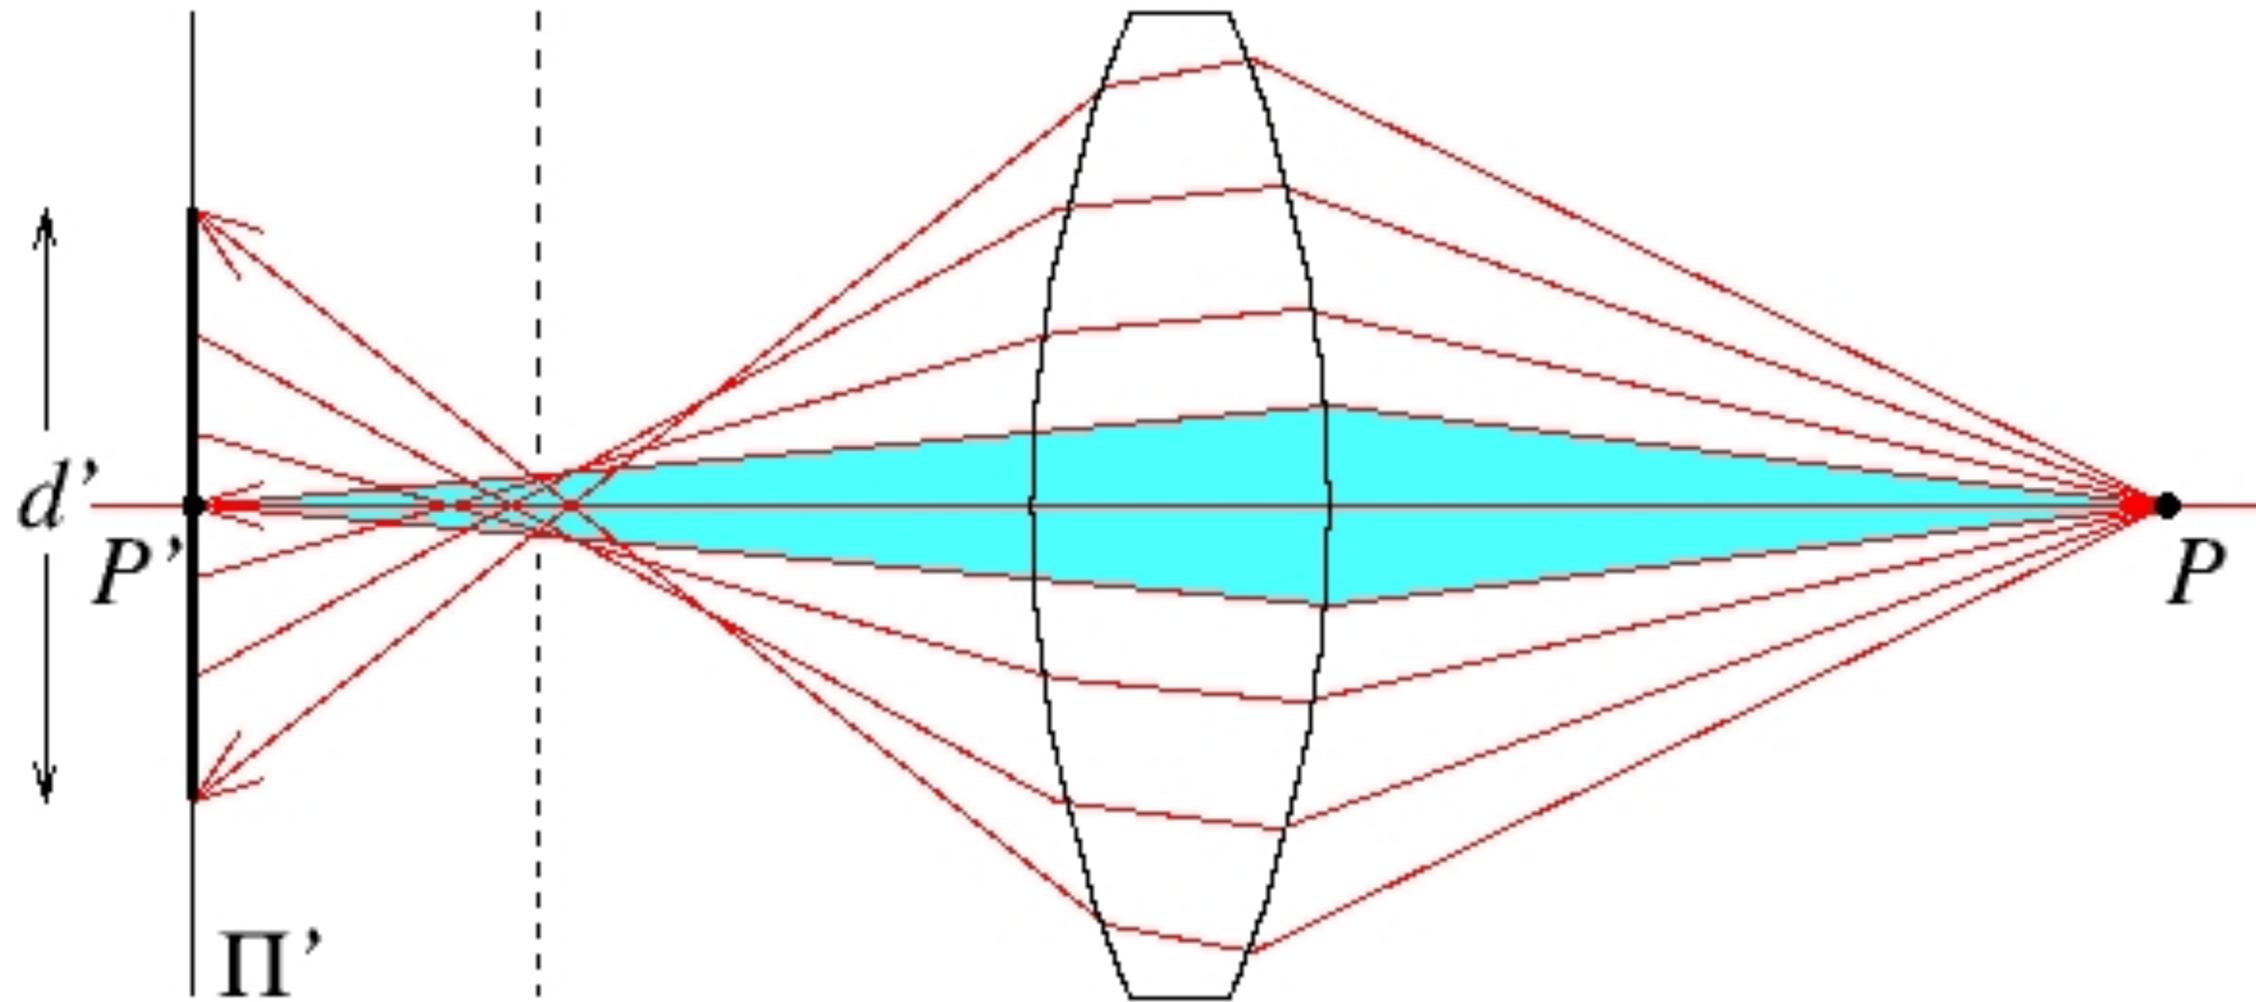

Aperture size = f/N , \Rightarrow large N = small aperture

Real Lenses

- Real Lenses have multiple stages of positive and negative elements with differing refractive indices
- This can help deal with issues such as chromatic aberration (different colours bent by different amounts), vignetting (light fall off at image edge) and sharp imaging across the zoom range

Spherical Aberration

Forsyth & Ponce (1st ed.) Figure 1.12a

Spherical **Aberration**

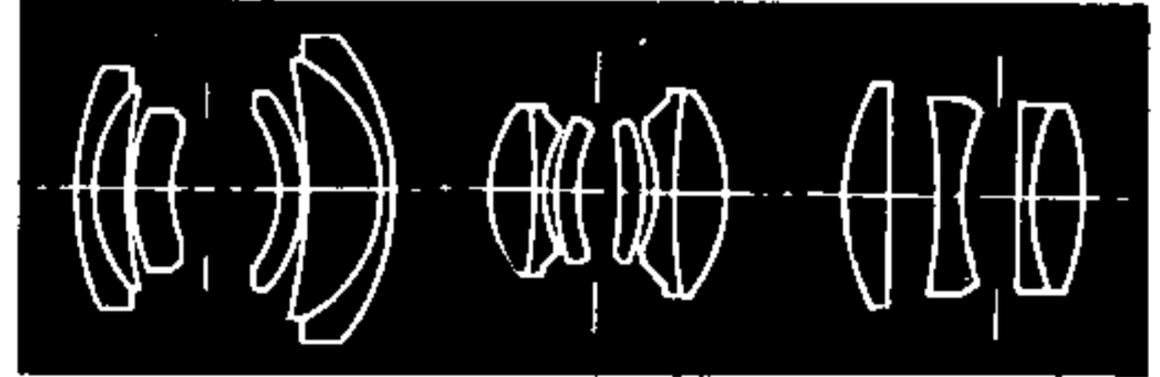

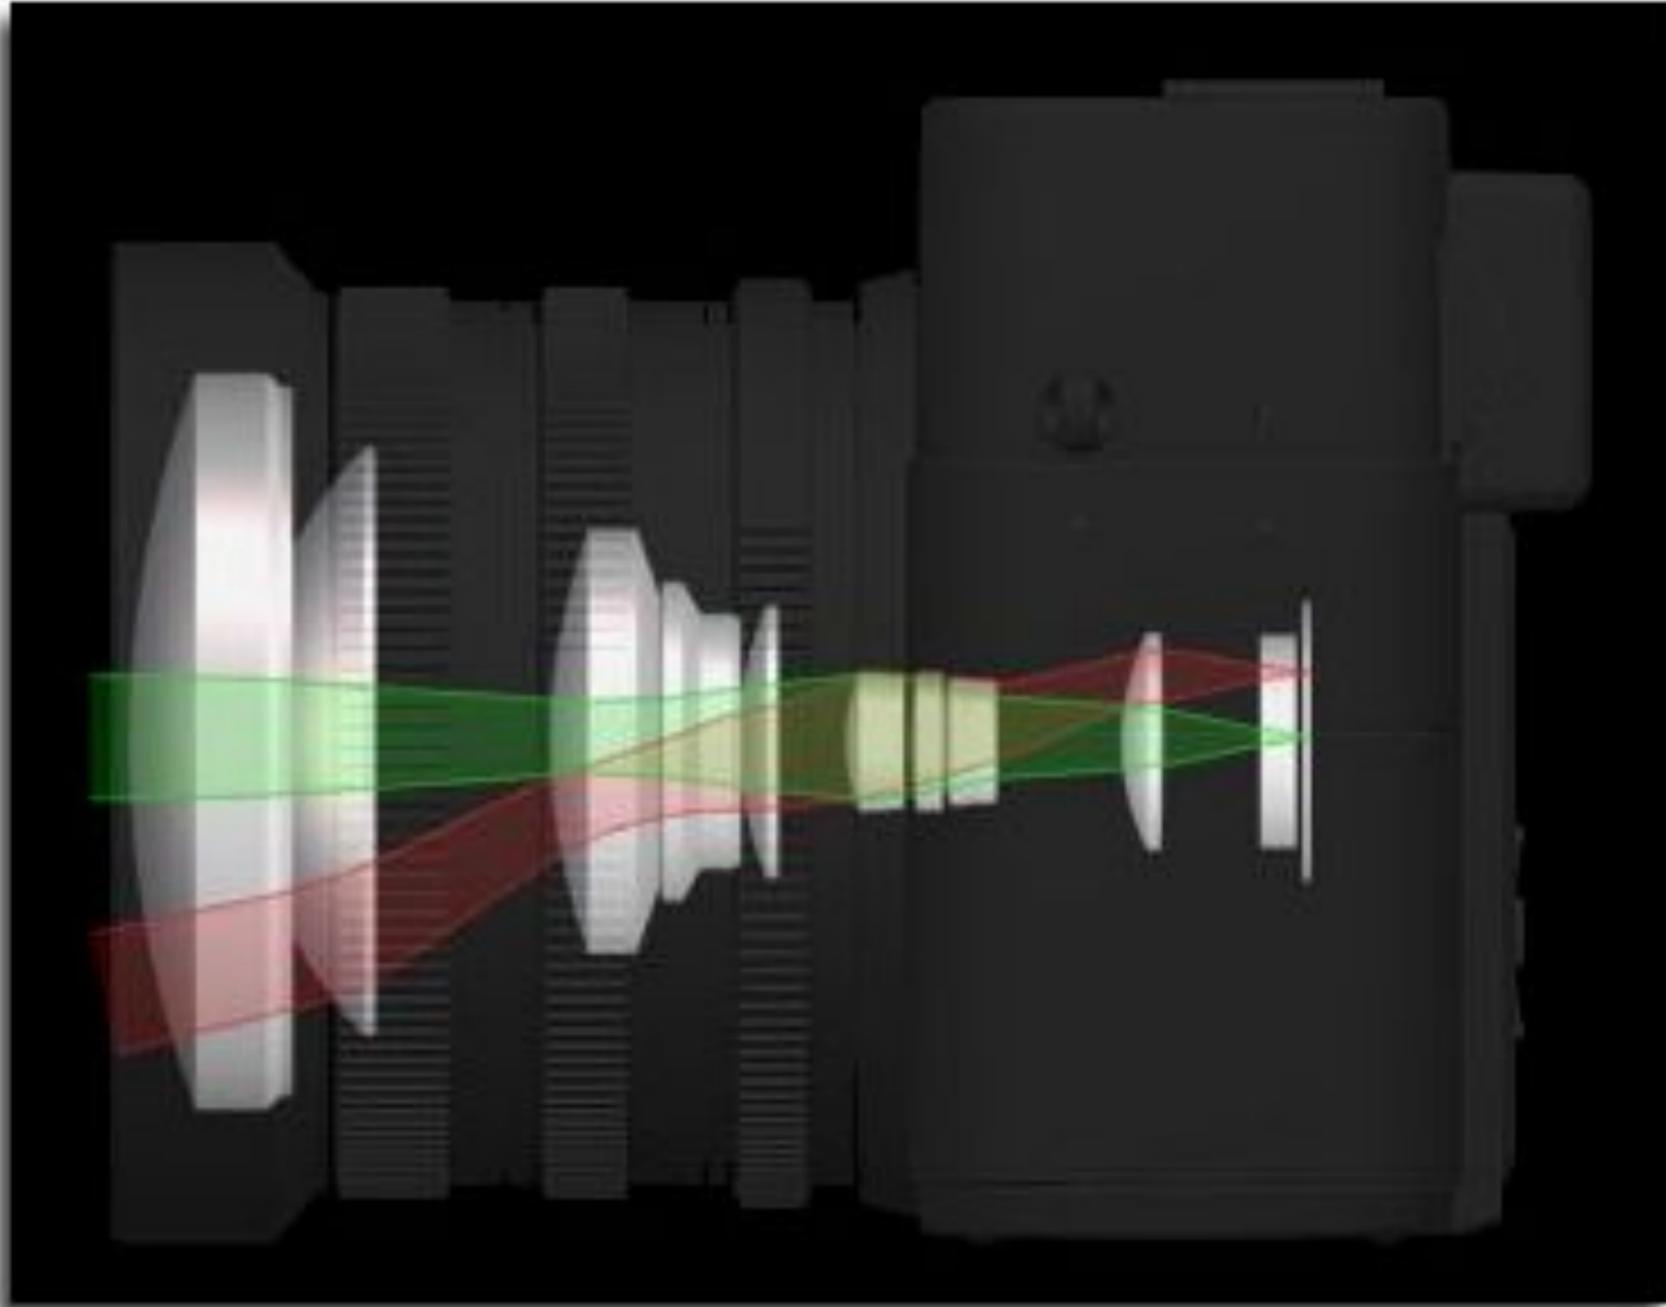

Un-aberrated image

Image from lens with Spherical Aberration

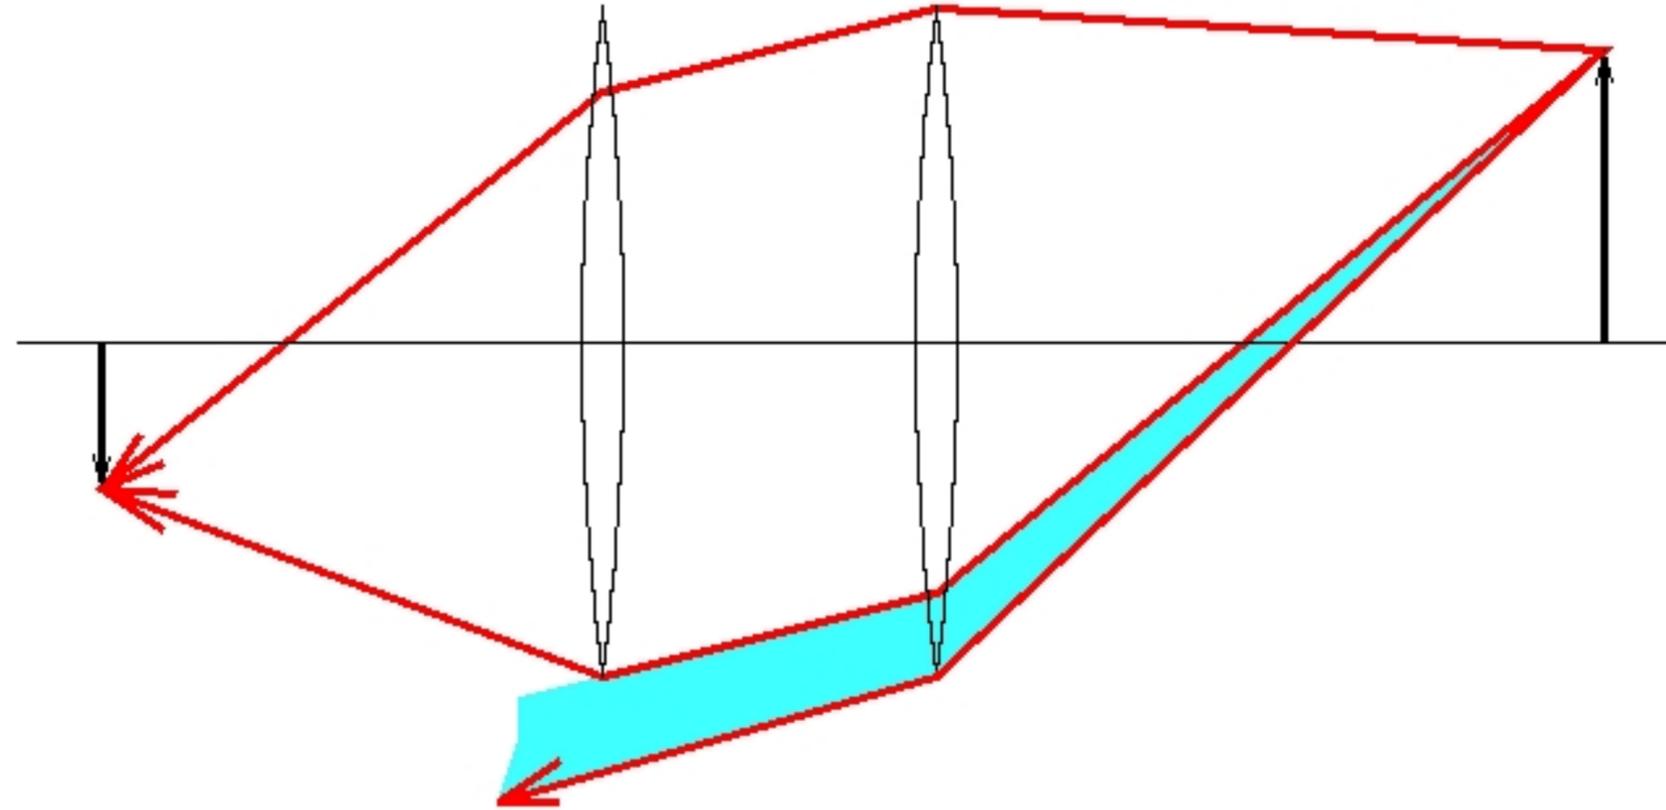

Compound Lens Systems

A modern camera lens may contain multiple components, including aspherical elements

Vignetting

Vignetting in a two-lens system

Forsyth & Ponce (2nd ed.) Figure 1.12

The shaded part of the beam **never reaches** the second lens

Vignetting

Image Credit: Cambridge in Colour

Chromatic **Aberration**

- Index of **refraction depends on wavelength**, λ , of light
- Light of different colours follows different paths
- Therefore, not all colours can be in equal focus

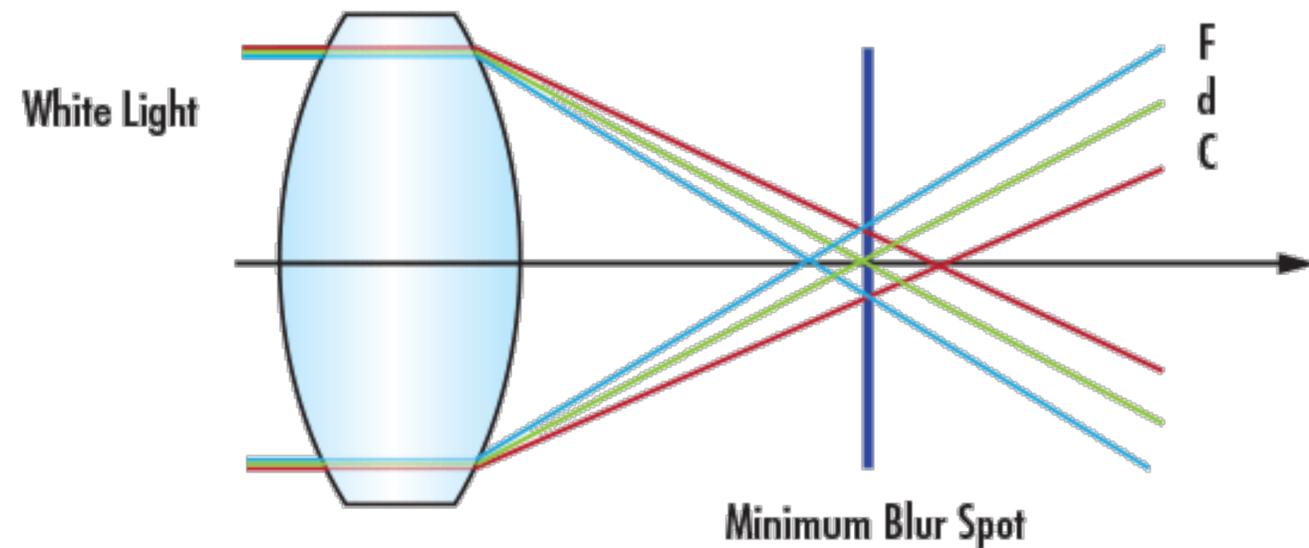

Image Credit: Trevor Darrell

Other (Possibly Significant) **Lens Effects**

Chromatic **aberration**

- Index of refraction depends on wavelength, λ , of light
- Light of different colours follows different paths
- Therefore, not all colours can be in equal focus

Scattering at the lens surface

- Some light is reflected at each lens surface

There are other **geometric phenomena/distortions**

- pincushion distortion
- barrel distortion
- etc

Lens Distortion

Fish-eye Lens

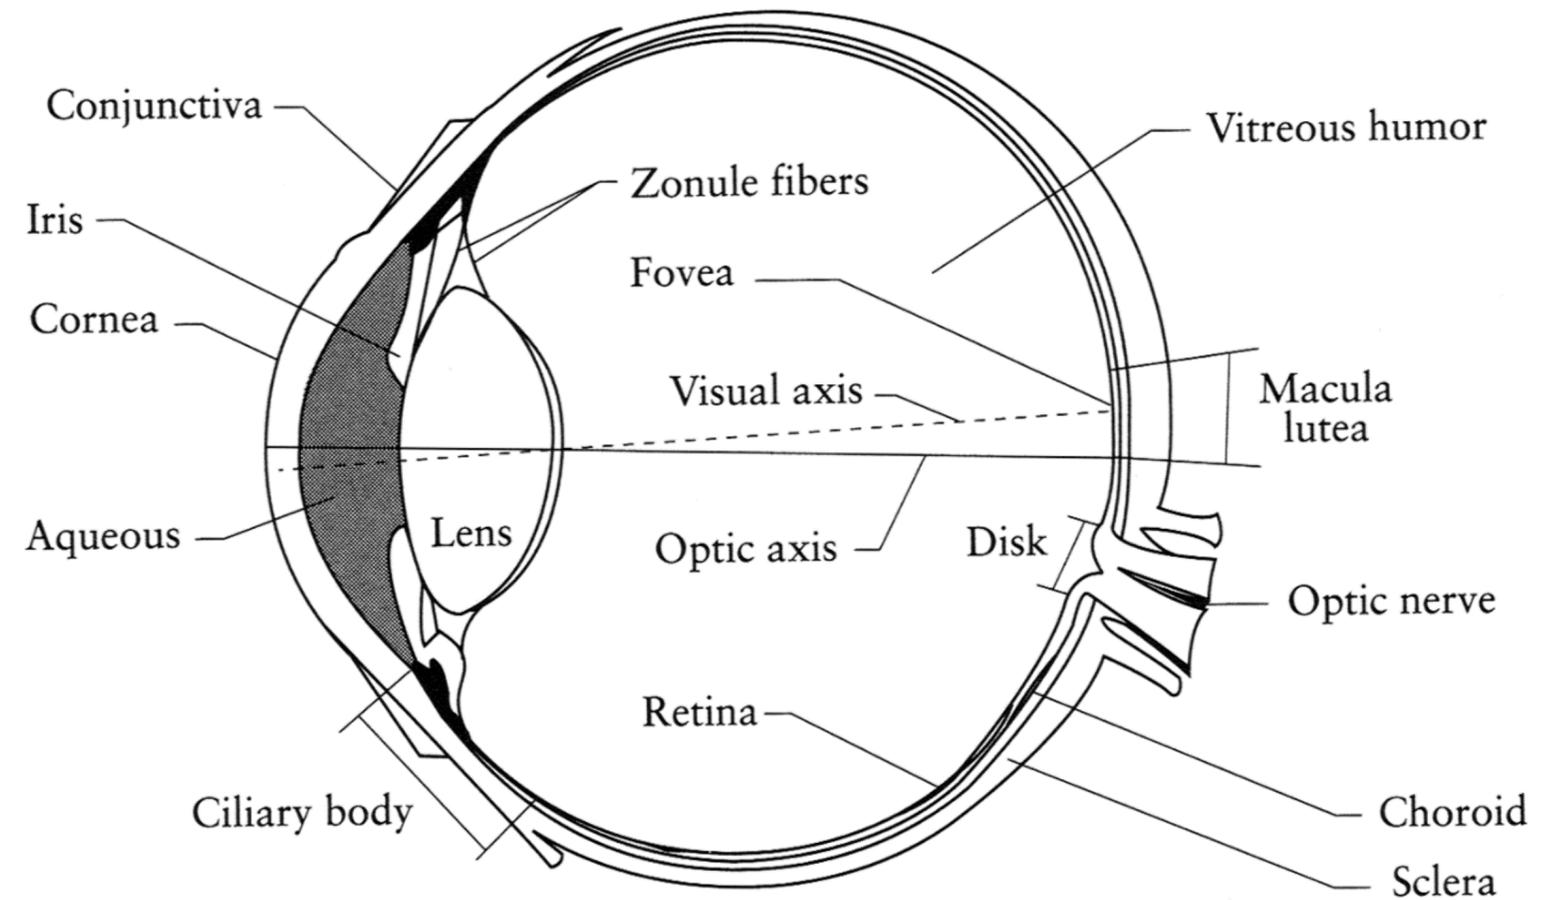

Szeliski (1st ed.) Figure 2.13

Lines in the world are no longer lines on the image, they are curves!

Human Eye

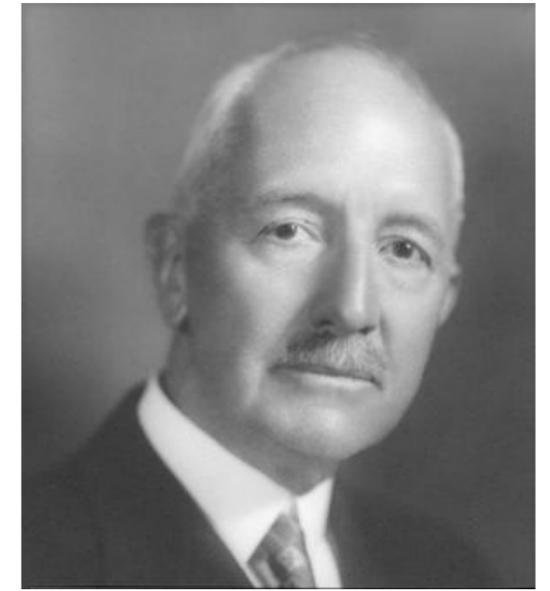

- The eye has an **iris** (like a camera)
- **Focusing** is done by changing shape of lens
- When the eye is properly focused, light from an object outside the eye is imaged on the **retina**
- The retina contains light receptors called **rods** and **cones**

pupil = pinhole / aperture

retina = film / digital sensor

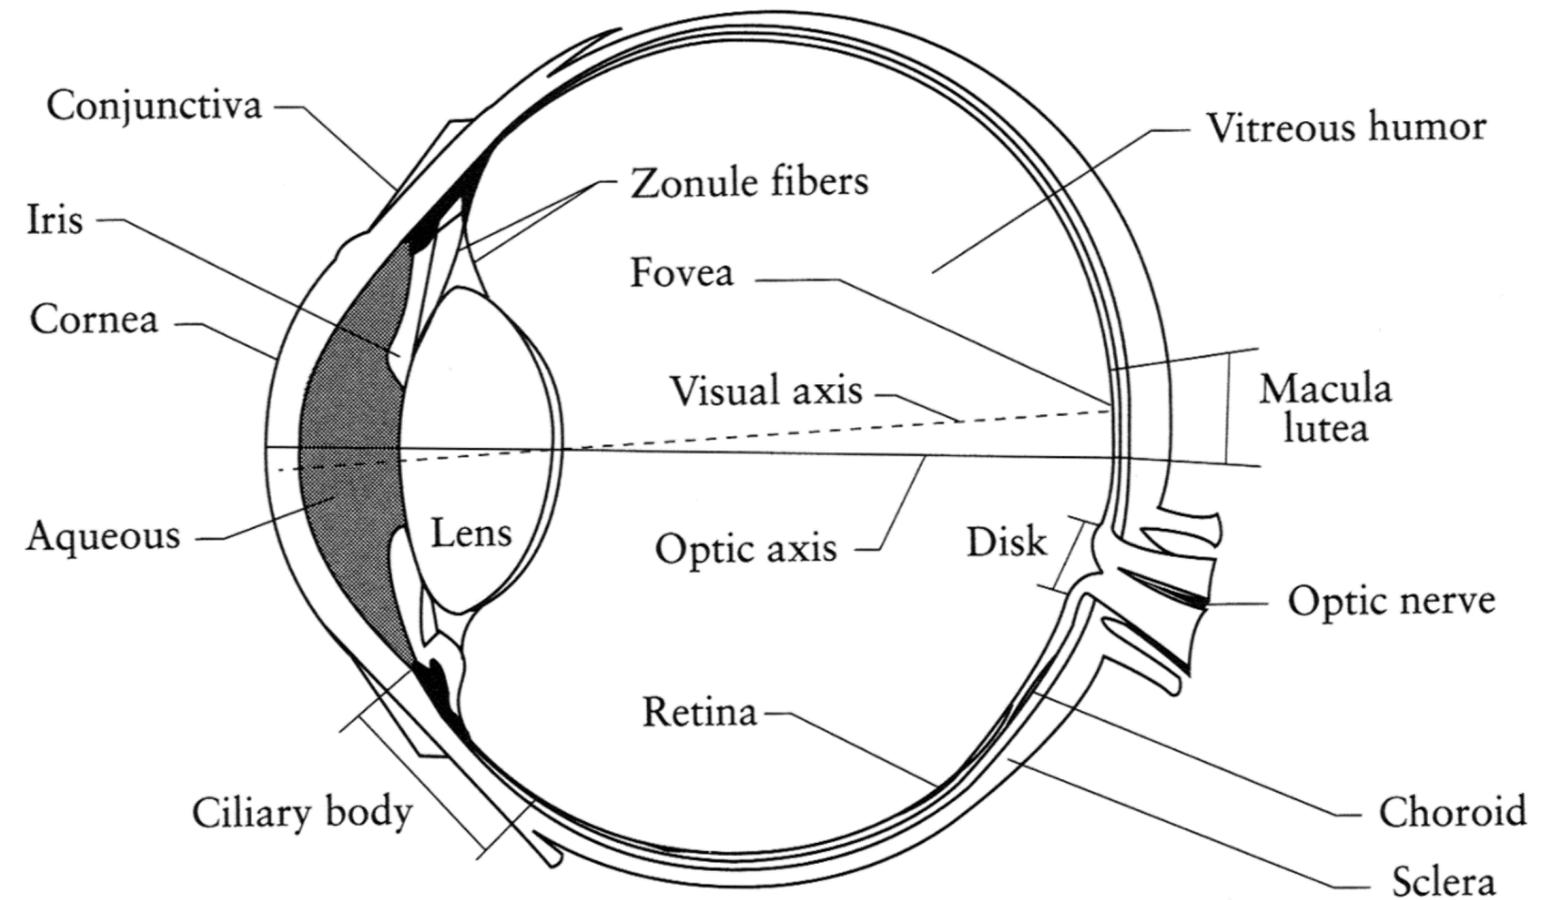

Fun **Aside**

George M. Stratton

Human Eye

- The eye has an **iris** (like a camera)
- **Focusing** is done by changing shape of lens

- When the eye is properly focused, light from an object outside the eye is imaged on the **retina**
- The retina contains light receptors called **rods** and **cones**

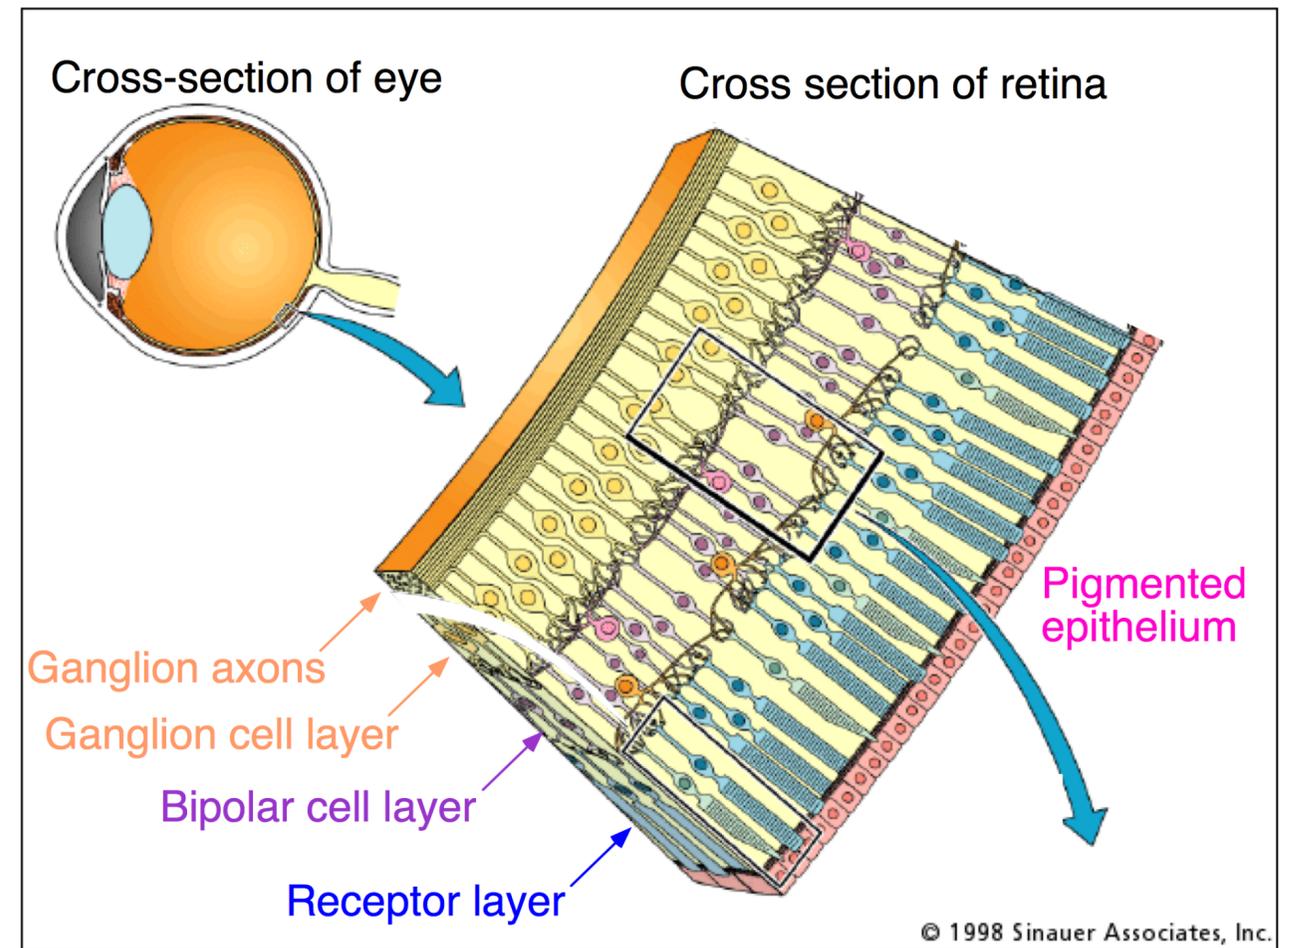

pupil = pinhole / aperture

retina = film / digital sensor

Two-types of **Light Sensitive Receptors**

Rods

75-150 million rod-shaped receptors

not involved in color vision, gray-scale vision only

operate at night

highly sensitive, can responding to a single photon

yield relatively poor spatial detail

Cones

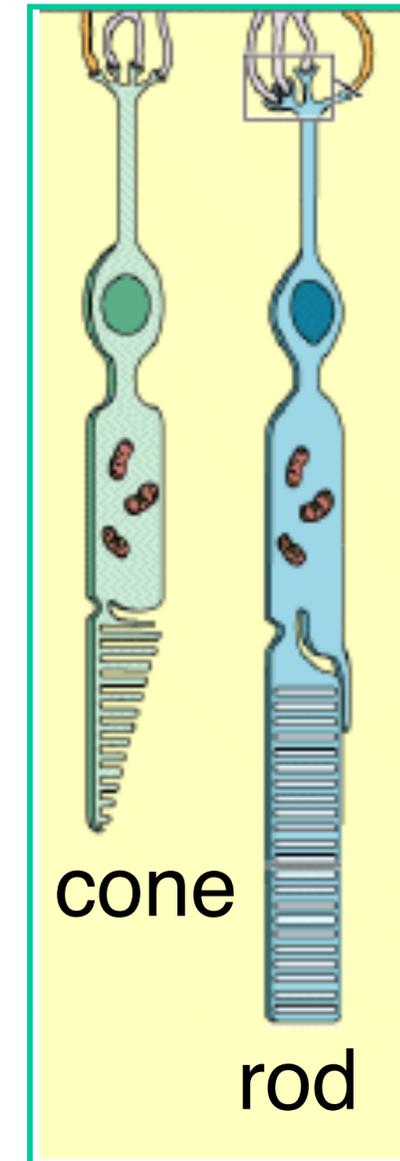

6-7 million cone-shaped receptors

color vision

operate in high light

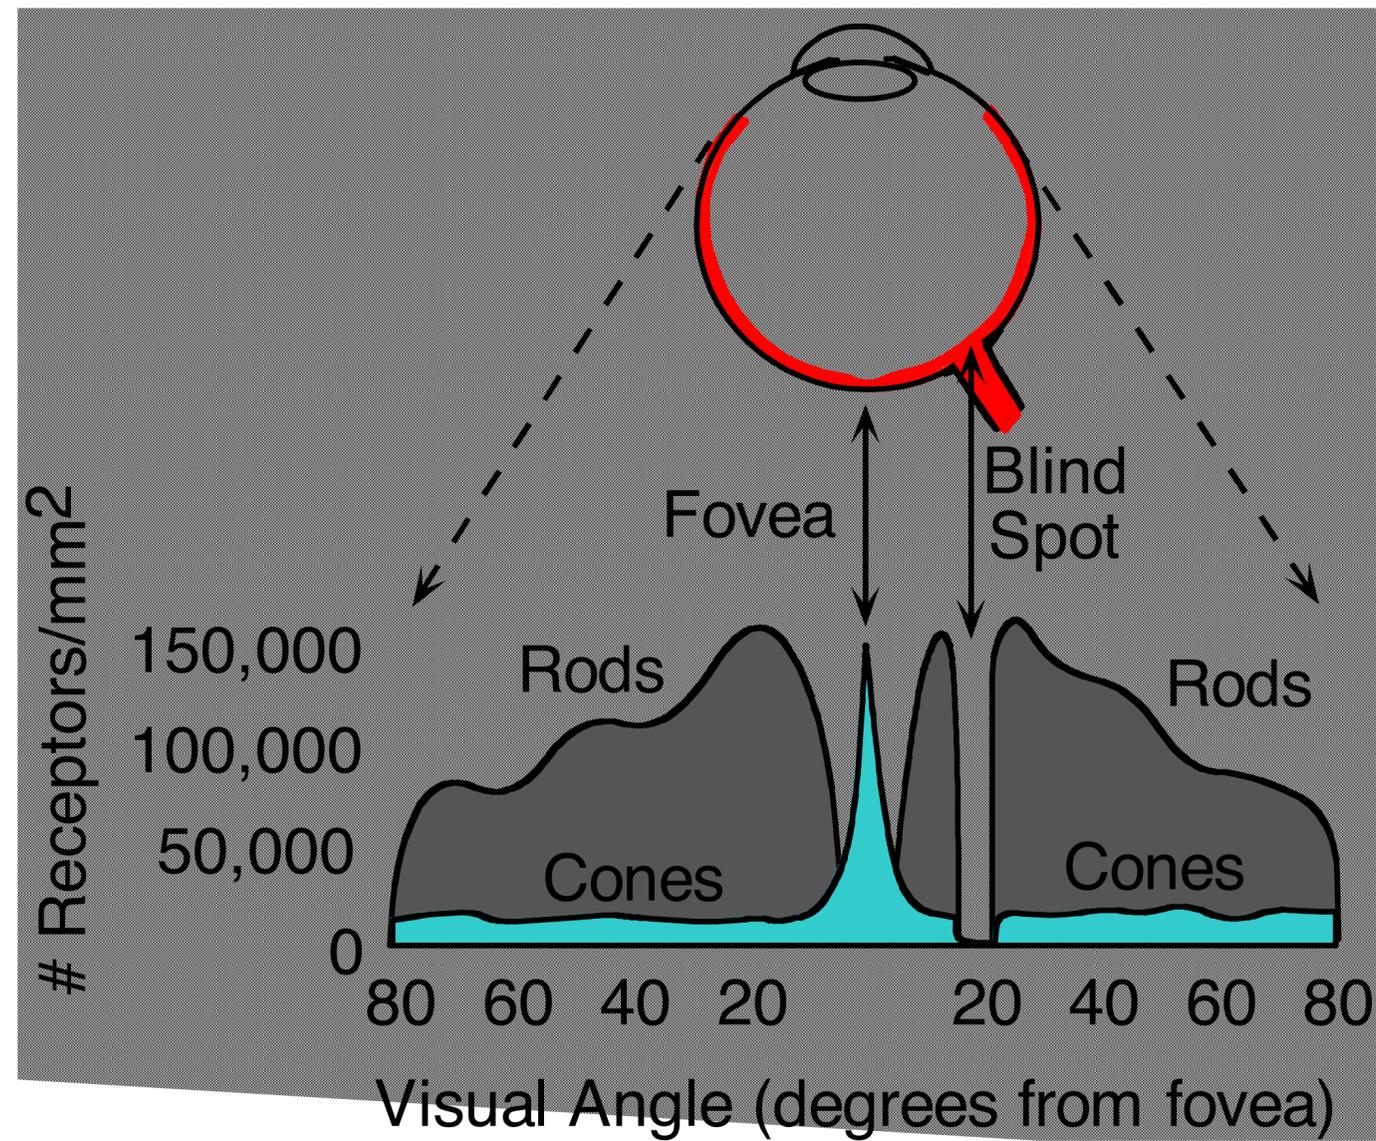

less sensitive

yield higher resolution

Human Eye

Density of rods and cones

Lecture **Summary**

- We discussed a “physics-based” approach to image formation. Basic abstraction is the **pinhole camera**.
- **Lenses overcome limitations** of the pinhole model while trying to preserve it as a useful abstraction
- Projection equations: **perspective**, weak perspective, orthographic
- Thin lens equation
- Some “aberrations and **distortions**” persist (e.g. spherical aberration, vignetting)
- The **human eye** functions much like a camera
