

#### THE UNIVERSITY OF BRITISH COLUMBIA

# Topics in AI (CPSC 532S): **Multimodal Learning with Vision, Language and Sound**

## Lecture 17: Generative Models [part 3], GANs

# Logistics

## **Project Proposals** were due Yesterday

Will try to grade and provide feedback over the weekend

This week:

- Start working on projects
- Start thinking about paper presentations

# Variational Autoencoders (VAE)

## PixelCNNs define tractable density function, optimize likelihood of training data:

 $p(x) = \prod p(x_i | x_1, ..., x_{i-1})$ 

$$p(x) = \prod_{i=1}^{n} p(x_i | x_1, \dots, x_{i-1})$$

VAEs define intractable density function with latent variables z (that we need to marginalize):

$$p_{\theta}(x) = \int f$$

cannot optimize directly, derive and optimize lower bound of likelihood instead

PixelCNNs define tractable density function, optimize likelihood of training data:

## $p_{\theta}(z)p_{\theta}(x|z)dz$

### Putting it all together:

maximizing the likelihood lower bound

$$\underbrace{\mathbf{E}_{z}\left[\log p_{\theta}(x^{(i)} \mid z)\right] - D_{KL}(q_{\phi}(z \mid x^{(i)}) \mid\mid p_{\theta}(z))}_{\mathcal{L}(x^{(i)}, \theta, \phi)}$$

Lets look at **computing the bound** (forward pass) for a given mini batch of input data

### Putting it all together:

maximizing the likelihood lower bound

$$\underbrace{\mathbf{E}_{z}\left[\log p_{\theta}(x^{(i)} \mid z)\right] - D_{KL}(q_{\phi}(z \mid x^{(i)}) \mid\mid p_{\theta}(z))}_{\mathcal{L}(x^{(i)}, \theta, \phi)}$$

### Putting it all together:

maximizing the likelihood lower bound

$$\mathbf{E}_{z} \left[ \log p_{\theta}(x^{(i)} \mid z) \right] - D_{KL}(q_{\phi}(z \mid x^{(i)}) \mid\mid p_{\theta}(z))$$

$$\mathcal{L}(x^{(i)}, \theta, \phi)$$
Make approximate posterior distribution close to prior

### Putting it all together:

maximizing the likelihood lower bound

$$\mathbf{E}_{z} \left[ \log p_{\theta}(x^{(i)} \mid z) \right] - D_{KL}(q_{\phi}(z \mid x^{(i)}) \mid\mid p_{\theta}(z))$$

$$\mathcal{L}(x^{(i)}, \theta, \phi)$$
Make approximate posterior distribution close to prior

### Putting it all together:

maximizing the likelihood lower bound

$$\mathbf{E}_{z} \left[ \log p_{\theta}(x^{(i)} \mid z) \right] - D_{KL}(q_{\phi}(z \mid x^{(i)}) \mid\mid p_{\theta}(z))$$

$$\mathcal{L}(x^{(i)}, \theta, \phi)$$
Make approximate posterior distribution close to prior

### Putting it all together:

maximizing the likelihood lower bound

Maximize likelihood of original input being reconstructed

$$\mathbf{E}_{z}\left[\log p_{\theta}(x^{(i)} \mid z)\right] - D_{KL}(q_{\phi}(z \mid x^{(i)}) \mid\mid p_{\theta}(z))$$

 $\mathcal{L}(x^{(i)}, \theta, \phi)$ 

Make approximate posterior distribution close to prior

### Putting it all together:

maximizing the likelihood lower bound

Maximize likelihood of original input being reconstructed

$$\mathbf{E}_{z}\left[\log p_{\theta}(x^{(i)} \mid z)\right] - D_{KL}(q_{\phi}(z \mid x^{(i)}) \mid\mid p_{\theta}(z))$$

 $\mathcal{L}(x^{(i)}, \theta, \phi)$ 

Make approximate posterior distribution close to prior

For every minibatch of input data: compute this forward pass, and then backprop!

![](_page_11_Figure_8.jpeg)

Use decoder network and sample z from **prior** 

![](_page_12_Figure_2.jpeg)

Sample z from  $z \sim \mathcal{N}(0, I)$ 

Use decoder network and sample z from **prior**

# Variational Autoencoders

Probabilistic spin to traditional autoencoders = allows generating data Defines an intractable density = derive and optimize a (variational) lower bound

### **Pros:**

- Principled approach to generative models
- Allows inference of q(z|x), can be useful feature representation for other tasks

## **Cons:**

- Maximizes lower bound of likelihood: okay, but not as good evaluation as PixelRNN/PixelCNN
- Samples blurrier and lower quality compared to state-of-the-art (GANs)

## Active area of research:

- More flexible approximations, e.g. richer approximate posterior instead of diagonal Gaussian
- Incorporating structure in latent variables (our submission to CVPR)

![](_page_27_Picture_0.jpeg)

PixelCNNs define tractable density function, optimize likelihood of training data:  $p(x) = \prod$ i=1

VAEs define intractable density function with latent variables z (that we need to marginalize):

$$p_{\theta}(x) = \int p_{\theta}(z) p_{\theta}(x|z) dz$$

cannot optimize directly, derive and optimize lower bound of likelihood instead

### What if we give up on explicitly modeling density, and just want to sample?

$$\left[ p(x_i | x_1, ..., x_{i-1}) \right]$$

![](_page_27_Picture_8.jpeg)

![](_page_27_Picture_9.jpeg)

![](_page_28_Picture_0.jpeg)

PixelCNNs define tractable density function, optimize likelihood of training data:  $p(x) = \prod$ i=1

VAEs define intractable density function with latent variables z (that we need to marginalize):

$$p_{\theta}(x) = \int p_{\theta}(z) p_{\theta}(x|z) dz$$

cannot optimize directly, derive and optimize lower bound of likelihood instead

### What if we give up on explicitly modeling density, and just want to sample?

GANs: don't work with any explicit density function

$$\left[ p(x_i | x_1, ..., x_{i-1}) \right]$$

![](_page_28_Picture_9.jpeg)

![](_page_28_Picture_10.jpeg)

# Generative Adversarial Networks (GANs)

**Problem:** Want to sample from complex, high-dimensional training distribution. There is no direct way to do this!

[Goodfellow et al., 2014]

![](_page_30_Picture_5.jpeg)

**Problem:** Want to sample from complex, high-dimensional training distribution. There is no direct way to do this!

**Solution:** Sample from a simple distributions, e.g., random noise. Learn transformation to the training distribution

Goodfellow et al., 2014

![](_page_31_Picture_7.jpeg)

**Problem:** Want to sample from complex, high-dimensional training distribution. There is no direct way to do this!

**Solution:** Sample from a simple distributions, e.g., random noise. Learn transformation to the training distribution

**Question:** What can we use to represent complex transformation function?

Goodfellow et al., 2014]

![](_page_32_Picture_9.jpeg)

![](_page_37_Picture_5.jpeg)

**Generator** network: try to fool the discriminator by generating real-looking images **Discriminator** network: try to distinguish between real and fake images

Train jointly in **minimax** game Discriminator outputs likelihood in (0,1) of real image Minimax objective function:

$$\min_{\theta_g} \max_{\theta_d} \left[ \mathbb{E}_{x \sim p_{data}} \log \underline{D_{\theta_d}(x)} + \mathbb{E}_{z \sim p(z)} \log(1 - \underline{D_{\theta_d}(G_{\theta_g}(z))}) \right]$$

$$\text{Discriminator output} \quad \text{Discriminator output} \quad \text{or real data x} \quad \text{denerated fake data G}$$

- **Discriminator** ( $\theta_d$ ) wants to maximize objective such that D(x) is close to 1 (real) and D(G(z)) is close to 0 (fake)
- into thinking generated G(z) is real)

Goodfellow et al., 2014]

or generated fake data G(z)

- **Generator** ( $\theta_{\alpha}$ ) wants to minimize objective such that D(G(z)) is close to 1 (discriminator is fooled

![](_page_38_Picture_13.jpeg)

![](_page_38_Picture_14.jpeg)

**Generator** network: try to fool the discriminator by generating real-looking images **Discriminator** network: try to distinguish between real and fake images

Train jointly in **minimax game** Discriminator outputs likelihood in (0,1) of real image Minimax objective function:

$$\min_{\theta_g} \max_{\theta_d} \left[ \mathbb{E}_{x \sim p_{data}} \log \underline{D_{\theta_d}(x)} + \mathbb{E}_{z \sim p(z)} \log(1 - \underline{D_{\theta_d}(G_{\theta_g}(z))}) \right]$$
  
Discriminator output Discriminator output for real data of the real

for real data x

The **Nash equilibrium** of this particular game is achieved when:

$$p_{data}(x) = p_{gen}(G_{\theta_g}(z)), \quad \forall x$$

or generated fake data G(z)

$$D_{\theta_d}(x) = 0.5, \quad \forall x$$

![](_page_39_Picture_11.jpeg)

Minimax objective function:  $\min_{\theta_g} \max_{\theta_d} \left[ \mathbb{E}_{x \sim p_{data}} \log D_{\theta_d}(x) + \mathbb{E}_{z \sim p(z)} \log(1 - D_{\theta_d}(G_{\theta_g}(z))) \right]$ 

Alternate between:

1. Gradient **ascent** on discriminator

$$\max_{\theta_d} \left[ \mathbb{E}_{x \sim p_{data}} \log D_{\theta_d}(x) + \mathbb{E}_z \right]$$

2. Gradient **descent** on generator

$$\min_{\theta_g} \mathbb{E}_{z \sim p(z)} \log(1 - D_{\theta_d}(G_{\theta_g}(z)))$$

[Goodfellow et al., 2014]

## $\sum_{z \sim p(z)} \log(1 - D_{\theta_d}(G_{\theta_g}(z)))$

)))

![](_page_40_Picture_13.jpeg)

experiments.

for number of training iterations do for k steps do

- Sample minibatch of m noise samples  $\{z^{(1)}, \ldots, z^{(m)}\}$  from noise prior  $p_g(z)$ . • Sample minibatch of m examples  $\{x^{(1)}, \ldots, x^{(m)}\}$  from data generating distribution
- $p_{\text{data}}(\boldsymbol{x}).$
- Update the discriminator by ascending its stochastic gradient:

$$\nabla_{\theta_d} \frac{1}{m} \sum_{i=1}^m \left[ \log D\left( \boldsymbol{x}^{(i)} \right) + \log \left( 1 - D\left( G\left( \boldsymbol{z}^{(i)} \right) \right) \right) \right].$$

#### end for

- Update the generator by descending its stochastic gradient:

$$\nabla_{\theta_g} \frac{1}{m} \sum_{i=1}^m \log\left(1 - D\left(G\left(\boldsymbol{z}^{(i)}\right)\right)\right).$$

#### end for

The gradient-based updates can use any standard gradient-based learning rule. We used momentum in our experiments.

#### Discriminator updates

Generator updates

Algorithm 1 Minibatch stochastic gradient descent training of generative adversarial nets. The number of steps to apply to the discriminator, k, is a hyperparameter. We used k = 1, the least expensive option, in our

• Sample minibatch of m noise samples  $\{z^{(1)}, \ldots, z^{(m)}\}$  from noise prior  $p_q(z)$ .

![](_page_41_Picture_19.jpeg)

Minimax objective function:  $\min_{\theta_{g}} \max_{\theta_{d}} \left[ \mathbb{E}_{x \sim p_{data}} \log D_{\theta_{d}}(x) + \mathbb{E}_{z \sim p(z)} \log(1 - D_{\theta_{d}}(G_{\theta_{g}}(z))) \right]$ 

Alternate between:

1. Gradient **ascent** on discriminator

$$\max_{\theta_d} \left[ \mathbb{E}_{x \sim p_{data}} \log D_{\theta_d}(x) + \mathbb{E}_z \right]$$

2. Gradient **descent** on generator

$$\min_{\theta_g} \mathbb{E}_{z \sim p(z)} \log(1 - D_{\theta_d}(G_{\theta_g}(z)))$$

In practice, optimizing this generator objective does not work well!

[Goodfellow et al., 2014]

## $\sim_{p(z)} \log(1 - D_{\theta_d}(G_{\theta_g}(z)))$

)))

![](_page_42_Picture_14.jpeg)

Minimax objective function:  $\min_{\theta_{q}} \max_{\theta_{d}} \left[ \mathbb{E}_{x \sim p_{data}} \log D_{\theta_{d}}(x) + \mathbb{E}_{z \sim p(z)} \log(1 - D_{\theta_{d}}(G_{\theta_{g}}(z))) \right]$ 

Alternate between:

1. Gradient **ascent** on discriminator

$$\max_{\theta_d} \left[ \mathbb{E}_{x \sim p_{data}} \log D_{\theta_d}(x) + \mathbb{E}_{z \sim p(z)} \log(1 - D_{\theta_d}(G_{\theta_g}(z))) \right]$$

2. Gradient **descent** on generator

$$\min_{\theta_g} \mathbb{E}_{z \sim p(z)} \log(1 - D_{\theta_d}(G_{\theta_g}(z)))$$

In practice, optimizing this generator objective does not work well!

#### Goodfellow et al., 2014]

Gradient signal

)))

where sample is already good  $\log(1 - D(G(z)))$ When sample is likely fake, want to learn from it to improve generator. But gradient in this region 0.0 0.2 0.4 0.6 0.8 1.0 is relatively flat! D(G(z))

\* slide from Fei-Dei Li, Justin Johnson, Serena Yeung, cs231n Stanford

![](_page_43_Picture_14.jpeg)

dominated by region

Minimax objective function:  $\min_{\theta_{g}} \max_{\theta_{d}} \left[ \mathbb{E}_{x \sim p_{data}} \log D_{\theta_{d}}(x) + \mathbb{E}_{z \sim p(z)} \log(1 - D_{\theta_{d}}(G_{\theta_{g}}(z))) \right]$ 

Alternate between:

1. Gradient **ascent** on discriminator

$$\max_{\theta_d} \left[ \mathbb{E}_{x \sim p_{data}} \log D_{\theta_d}(x) + \mathbb{E}_{z} \right]$$

2. Instead, gradient **ascent** on generator, different objective

$$\max_{\theta_g} \mathbb{E}_{z \sim p(z)} \log(D_{\theta_d}(G_{\theta_g}(z)))$$

Instead of minimizing likelihood of discriminator being correct, now maximize likelihood of discriminator being wrong.

Same objective of fooling discriminator, but now higher gradient signal for bad samples => works much better! Standard in practice.

#### Goodfellow et al., 2014
