# Course Updates

Midterm is today @ 5pm

# Lighting and Reflections

Computer Graphics, CSCD18

Fall 2007

Instructor: Leonid Sigal

#### Introduction

- So far we have only considered in our rendering pipeline
  - Geometry of the scene
  - Camera modeling
- We did not consider
  - Lighting
  - Shading of polygons (must account for properties of the surface)
  - Shadows

#### Introduction

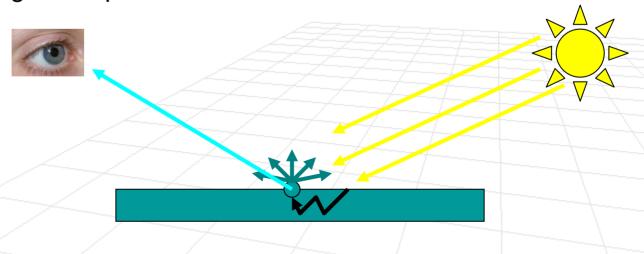

- In general, to reason about shading, lighting and shadows
  - We must consider every light ray that hits every surface in the scene
    - Rays that come directly from the light source
    - Rays that are reflected from different object surfaces
  - This is impractical for most scenes
  - We need to make simplifications

## | Lighting Basics

- Light sources
  - Point sources (e.g. sun)
    - Light is reflected in all directions from the small light source far away
  - Extended light sources (e.g. day lights)
    - Light is reflected in all directions but from many points
  - Directional lighting
  - Secondary lighting
    - Light reflected from other objects

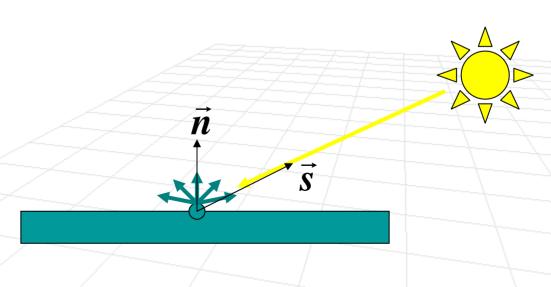

#### Reflection Basics

- Reflectance (different objects reflect light in different ways)
  - □ Diffuse surfaces (e.g. egg)
    - Appear the same from all directions
  - Secular surfaces (e.g. mirrors)
    - Reflected light is a function of the viewing direction
  - Transmission (e.g. skin, glass, water)
    - Light can penetrate the surface

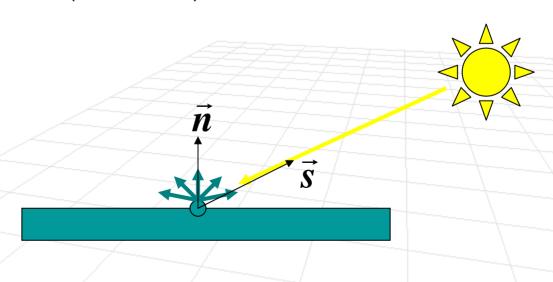

#### Diffuse Reflection

- Idea: reflected light is the same in all directions
- Assumptions: point light source
- Simplest model:  $L_d(\bar{p}) = r_d I \max(0, \vec{s} \cdot \vec{n})$ 
  - I intensity of the light source
  - $r_d$  fraction of the light being reflected
  - $\vec{s}$  direction of the light source
  - $\vec{n}$  surface normal

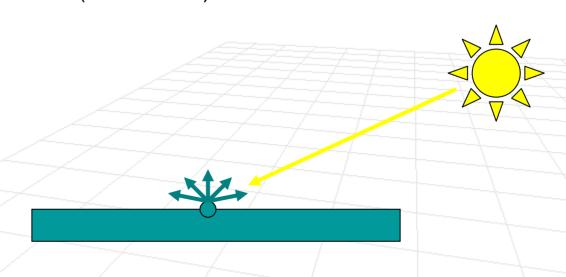

#### Diffuse Reflection

- Idea: reflected light is the same in all directions
- Assumptions: point light source
- Simplest model:  $L_d(\overline{p}) = r_d I \max(0, \vec{s} \cdot \vec{n})$  Why?
  - I intensity of the light source
  - $r_d$  fraction of the light being reflected
  - $\vec{s}$  direction of the light source (normalized)
  - $\vec{n}$  surface normal (normalized)

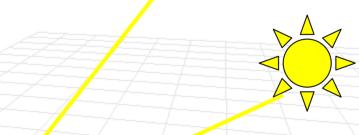

#### Diffuse Reflection

- Idea: reflected light is the same in all directions
- Assumptions: point light source
- Simplest model:  $L_d(\bar{p}) = r_d I \max(0, \vec{s} \cdot \vec{n})$ 
  - I intensity of the light source
  - $r_d$  fraction of the light being reflected
  - $\vec{s}$  direction of the light source (normalized)
  - $\vec{n}$  surface normal (normalized)

## Diffuse Reflection with Multiple Lights

- Idea: reflected light is the same in all directions
- Assumptions: point light source
- Light is additive, so  $L_d(\overline{p}) = \sum_i r_d I_j \max(0, \vec{s}_j \cdot \vec{n})$ 
  - $I_i$  intensity of the light source j
  - $r_d$  fraction of the light being reflected
  - $\vec{s}_i$  direction of the light source j (normalized)
  - $\vec{n}$  surface normal (normalized)

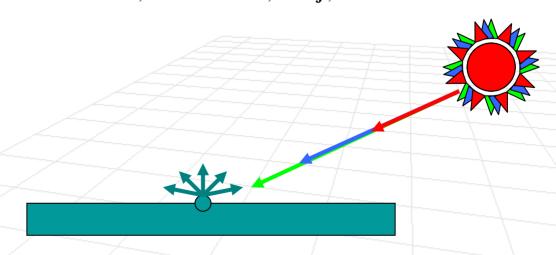

#### What about color?

- Idea: reflected light is the same in all directions
- Assumptions: point light source
- We can specify reflectance and light intensity in terms of color components  $L_{d,R}(\overline{p}) = r_{d,R} I_{i,R} \max(0, \vec{s} \cdot \vec{n})$

$$L_{d,G}(\overline{p}) = r_{d,G} I_{i,G} \max(0, \vec{s} \cdot \vec{n})$$

$$L_{d,B}(\overline{p}) = r_{d,B} I_{i,B} \max(0, \vec{s} \cdot \vec{n})$$

#### Ambient Illumination

- Diffuse reflection with point light source produce strong shadows
- Surface patches that point away from the light source,  $\vec{s} \cdot \vec{n} < 0$ , end up being black. This looks unnatural. Why?

#### Solutions

- Have many light sources to approximate an extended light source
- Use ambient reflectance
  - Approximates the average amount of light in the scene

### Ambient Illumination

Simple ambient reflectance

$$L_a(\overline{p}) = r_a I_a$$

 $oldsymbol{I}_a$  - amount of ambient illumination

 $r_a$  - ambient reflection coefficient (how much light is reflected) (often people set  $r_a = r_d$ )

Color ambient reflectance

$$egin{aligned} oldsymbol{L}_{a,R}(oldsymbol{ar{p}}) &= oldsymbol{r}_{a,R} oldsymbol{I}_{a,R} \ oldsymbol{L}_{a,G}(oldsymbol{ar{p}}) &= oldsymbol{r}_{a,G} oldsymbol{I}_{a,G} \ oldsymbol{L}_{a,B}(oldsymbol{ar{p}}) &= oldsymbol{r}_{a,B} oldsymbol{I}_{a,B} \end{aligned}$$

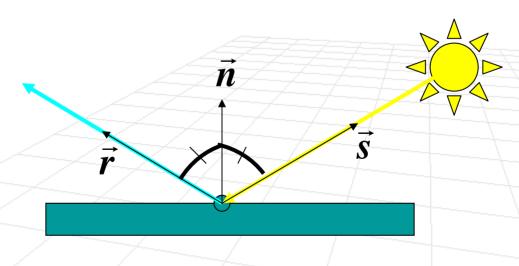

### Diffuse Reflectance Model

Increasing ratio of ambient to diffuse reflection:

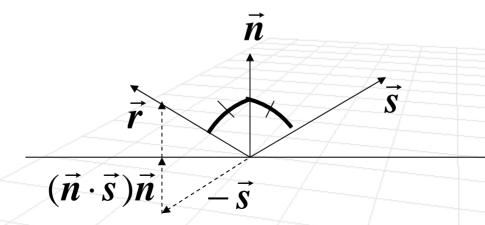

- Idealization: a mirror
- Models plastics, metals, and polished surfaces
- Property: Angle of reflection equal to the angle of incident with respect to the normal

- is unit vector corresponding to emitting direction (it is determined by the normal and the light source)

- Idealization: a mirror
- Models plastics, metals, and polished surfaces
- Property: Angle of reflection equal to the angle of incident with respect to the normal

$$\vec{r} = 2(\vec{n} \cdot \vec{s})\vec{n} - \vec{s}$$

In practice most specular surfaces reflect light close to this direction

Common specular model

$$L_s(\overline{p}, \overrightarrow{c}) = r_s I_s \max(0, \overrightarrow{r} \cdot \overrightarrow{c})^{\alpha}$$

#### where

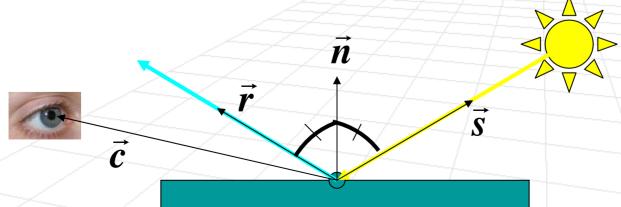

r - specular reflectance coefficient (how much light is reflected)

 $I_s$  - "specular light source" (often =  $I_d$ )

 $\vec{r}$  - direction of emission (normalized)

 $ec{c}$  - direction from the point to camera (normalized)

lpha - controls width of the highlight

 As we decrease alpha the reflection becomes more peaked (more like a mirror)

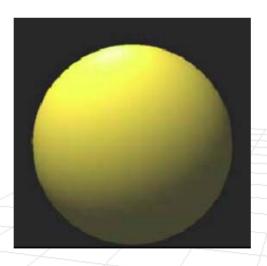

- Lets put all the peaces together
- Remember: light is additive

$$L(\overline{p}, \overrightarrow{c}) = r_d I_d \max(0, \overrightarrow{s} \cdot \overrightarrow{n}) + r_a I_a + r_s I_s \max(0, \overrightarrow{r} \cdot \overrightarrow{c})^{\alpha}$$

- Lets put all the peaces together
- Remember: light is additive

$$L(\overline{p}, \overrightarrow{c}) = r_d I_d \max(0, \overrightarrow{s} \cdot \overrightarrow{n}) + r_a I_a + r_s I_s \max(0, \overrightarrow{r} \cdot \overrightarrow{c})^{\alpha}$$

- Lets put all the peaces together
- Remember: light is additive

$$L(\overline{p}, \overrightarrow{c}) = r_d I_d \max(0, \overrightarrow{s} \cdot \overrightarrow{n}) + r_a I_a + r_s I_s \max(0, \overrightarrow{r} \cdot \overrightarrow{c})^{\alpha}$$

for color

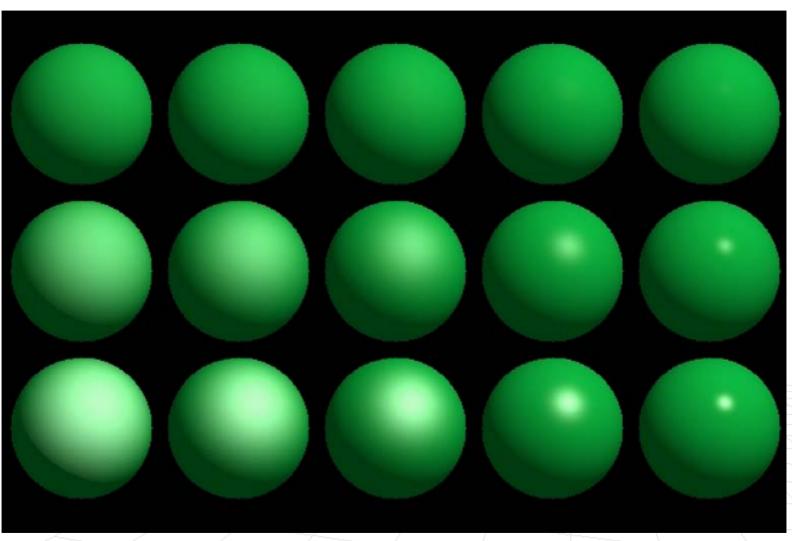

$$L_{R}(\overline{p}, \overrightarrow{c}) = r_{d,R} I_{d,R} \max(0, \overrightarrow{s} \cdot \overrightarrow{n}) + r_{a,R} I_{a,R} + r_{s,R} I_{s,R} \max(0, \overrightarrow{r} \cdot \overrightarrow{c})^{\alpha}$$

$$L_{G}(\overline{p}, \overrightarrow{c}) = r_{d,G} I_{d,G} \max(0, \overrightarrow{s} \cdot \overrightarrow{n}) + r_{a,G} I_{a,G} + r_{s,G} I_{s,G} \max(0, \overrightarrow{r} \cdot \overrightarrow{c})^{\alpha}$$

$$L_{B}(\overline{p}, \overrightarrow{c}) = r_{d,B} I_{d,B} \max(0, \overrightarrow{s} \cdot \overrightarrow{n}) + r_{a,B} I_{a,B} + r_{s,B} I_{s,B} \max(0, \overrightarrow{r} \cdot \overrightarrow{c})^{\alpha}$$

 Notice we are still only considering point light source and are not considering secondary reflectance from surfaces

Increasing ratio of diffuse to specular reflection coefficients

Increasing exponent in specular term
