

Singleton...

Structure

```

class Singleton
{
    static Instance()
    SingletonOperation()
    GetSingletonData
    static uniqueInstance
    singletonData
}
    
```

return uniqueInstance

An Example

- I used a variation on the Singleton pattern recently when developing a data-flow analysis program. This program reads through C source code and determines all possible definitions for a given use of a variable.

```

2 int a, b;
3 a = 1;
4 b = a + 1; use of a defined at 2
5 a = 2;
6 b = a * 2; use of a defined at 5
    
```

Need to track line-number; only at one line at any given time

8

Example...

```

class LineInfo {
public:
    void setLineNumber (int);
    int getLineNumber ();
};
class LastLineInfo: public LineInfo {
public:
    static LineInfo* Instance();
protected:
    LastLineInfo();
private:
    static LineInfo* _instance;
}
    
```

A Common Situation

- You've partitioned your system into a collection of cooperating classes. This partitioning has the advantage that you might be able to reuse the classes. But...
 - you need to maintain consistency between related objects. To maintain reusability, you don't want to tightly couple the classes...
- Some examples...

Observer Pattern...

Applicability

Use when:

- "an abstraction has two aspects, one dependent on the other. Encapsulating these aspects in separate objects lets you vary and reuse them independently.
- When a change to one object requires changing the others and you don't know how many objects need to be changed.
- When an object should be able to notify other objects without making assumptions about who those objects are." [Gang of Four, p. 294]

Observer Pattern: Structure

```

classDiagram
    class Subject {
        +Attach(Observer)
        +Detach(Observer)
        +Notify()
    }
    class ConcreteSubject {
        +GetState()
        +SetState()
        -subjectState
    }
    class Observer {
        +Update()
    }
    class ConcreteObserver {
        +Update()
        -observerState
    }
    Subject <|-- ConcreteSubject
    Observer <|-- ConcreteObserver
    Subject --> Observer : observers
    
```

Observer Pattern: Collaborations

Collaborations

Two configurations of interest: setting up the publish-subscribe interaction; actually causing the interaction to occur.

```

sequenceDiagram
    participant S as aConcreteSubject
    participant O as aConcreteObserver
    participant AO as another ConcreteObserver
    S->>O: Attach(aConcreteObserver)
    S->>AO: Attach(anotherConcreteObserver)
    
```

ObserverPattern: Collaborations...

```

sequenceDiagram
    participant S as aConcreteSubject
    participant O as aConcreteObserver
    participant AO as another ConcreteObserver
    S->>S: Notify()
    S->>O: Update()
    S->>O: GetState()
    O->>AO: Update()
    O->>AO: GetState()
    
```

A Sample Implementation of the Observer Pattern

- In Java**

```

public class Subject {
    public void attach( Observer obs ) {
        // add to list of Observers }
    public void notify() {
        // for each obs in Observers list
        // obs->update(); }
    private /* listOfObservers
}

public class Observer {
    public void update() {
        // draw a graph
        // or something
    }
}
    
```

This code could be provided in a library.

A Sample Use of the Observer Pattern

```

public class Spreadsheet extends Subject {
    public void newCellValue( ... ) {
        // Remember the new value
        // Then inform observers
        notify();
    }
}

public class Graph extends Observer {
    public void update() {
        // Better ask Subject for new
        // values and update the graph!
    }
}
    
```

Implementation Issues

- Observing more than one subject
 - need to extend Update interface to know which subject is notifying the Observer
- Who triggers the update?
 - State-setting operations on Subject (Observable) call Notify after they change the subject's state.
 - Advantage: Clients don't have to know about notify
 - Disadvantage: ?
 - If there are several consecutive updates it may be inefficient.

 CPSC 310
 © G. Murphy

Implementation Issues...

- Who triggers the update...
 - Clients call Notify at the right time.
 - Advantage: Handle the consecutive change scenario
 - Disadvantage: Clients have to do it.
- Dangling references to deleted subjects
 - Have subject notify observers when it is destructed
- Specifying modifications of interest explicitly
 - Extend the subject's registration interface to allow observers to register for specific events

Oct. 5, 1998
 CPSC 310
 © G. Murphy

Implementation Issues...

- Avoiding observer-specific update protocols: push and pull models
 - Push: subject sends observers detailed information about change whether they want it or not
 - Pull: Subject sends nothing; observers ask for details explicitly
- The push model may make observers less reusable. The pull model may be inefficient

Other Uses of ObserverPattern

- Smalltalk Model/View/Controller (MVC)
- Smalltalk and ET++ provide a general dependency mechanism of Subject/Observer in the parent class of all other classes in the system
- InterViews, Andrew, Unidraw

Some Patterns...

- Abstract Factory
- Builder
- Factory Method
- Prototype
- Singleton

Creational

- Adapter
- Bridge
- Composite
- Decorator

Structural

- Façade
- Flyweight
- Proxy
- Chain of Responsibility
- Command
- Interpreter
- Iterator
- Mediator
- Memento
- Observer...

Behavioural
