Testability wrt LLVM

Testability wrt YikYak

Key questions

Is a test suite:

Sufficiently **broad**?

Sufficiently **deep**?

Test suite
breadth

Code coverage

Code:

```
int eval(int x,  
         boolean c1,  
         boolean c2) {  
    if (c1)  
        x++;  
    if (c2)  
        x--;  
    return x;  
}
```

Code:

Test:

```
eval(0, false, false);
```

```
int eval(int x,  
         boolean c1,  
         boolean c2) {
```

```
    if (c1)
```

```
        x++;
```

```
    if (c2)
```

```
        x--;
```

```
    return x;
```

```
}
```

Code:

Test:

```
eval(0, false, false);
```

```
int eval(int x,  
         boolean c1,  
         boolean c2) {
```

```
    if (c1)
```

```
        x++;
```

```
    if (c2)
```

```
        x--;
```

```
    return x;
```

```
}
```

Statement:

Code:

Test:

```
eval(0, false, false);
```

```
int eval(int x,  
         boolean c1,  
         boolean c2) {  
    if (c1)  
        x++;  
    if (c2)  
        x--;  
    return x;  
}
```

Statement:

Coverage takeaway

More testing is
better than
artificially
broad testing.

High-level comments

- ▶ Testability is a function of the structure of the code, not a function of what it does.
- ▶ Structural constraints inhibit testing.
 - ▶ Global state
 - ▶ Hard-coded object creation (aka `new`)
 - ▶ References to time
- ▶ Code should always ‘ask’ for what it needs, not search for it.
 - ▶ E.g., constructors should state dependencies.
- ▶ Don’t assume the system is fixed: sometimes tests require restructuring.

An example

```
public class InboxSyncer {  
  
    private static final InboxSyncer instance =  
        new InboxSyncer(Config.get());  
    public static getInstance() { return instance; }  
    private final Certificate cert;  
    private final String username;  
    private final String password;  
    private long lastSync = -1;  
  
    private InboxSyncer(Config config) {  
        this.cert = DESReader.read(config.get("cert.path"));  
        User user = config.getUser();  
        this.username = user.getUsername();  
        this.password = user.getPassword();  
    }  
    public sync() {  
        ...  
    }  
}
```

An example

```
public sync() {
    long syncFrom = lastSync;
    if (syncFrom == -1) {
        syncFrom = new Date().getTime() - Def.SYNC_AMOUNT;
    }
    POPConnector pop =
        new POPConnector(cert, username, password);
    pop.connect();
    try {
        ...
    } finally {
        pop.disconnect();
    }
}
```

Global state

```
public class InboxSyncer {  
  
    private static final InboxSyncer instance =  
        new InboxSyncer(Config.get());  
    public static getInstance() { return instance; }  
    private final Certificate cert;  
    private final String username;  
    private final String password;  
    private long lastSync = -1;  
  
    private InboxSyncer(Config config) {  
        this.cert = DESReader.read(config.get("cert.path"));  
        User user = config.getUser();  
        this.username = user.getUsername();  
        this.password = user.getPassword();  
    }  
    public sync() {  
        ...  
    }  
}
```

Other configuration

```
public class InboxSyncer {  
  
    private static final InboxSyncer instance =  
        new InboxSyncer(Config.get());  
    public static getInstance() { return instance; }  
    private final Certificate cert;  
    private final String username;  
    private final String password;  
    private long lastSync = -1;  
  
    private InboxSyncer(Config config) {  
        this.cert = DESReader.read(config.get("cert.path"));  
        User user = config.getUser();  
        this.username = user.getUsername();  
        this.password = user.getPassword();  
    }  
    public sync() {  
        ...  
    }  
}
```

An example

```
public sync() {
    long syncFrom = lastSync;
    if (syncFrom == -1) {
        syncFrom = new Date().getTime() - Def.SYNC_AMOUNT;
    }
    Inbox inbox = Inbox.get(username);
    POPConnector pop =
        new POPConnector(cert, username, password);
    pop.connect();
    try {
        ...
    } finally {
        pop.disconnect();
    }
}
```

Improved structure

```
public class InboxSyncer {  
  
    private final POPConnector _pop;  
    private final String _username;  
    private final String _password;  
    private long _lastSync = -1;  
  
    private InboxSyncer(POPConnector pop,  
        String user, String pass, long defaultSync) {  
        _pop = pop;  
        _username = user;  
        _password = pass;  
        _lastSync = defaultSync;  
    }  
    public sync() {  
        ...  
    }  
}
```

Improved structure

```
public sync(Date now) {  
    Date syncFrom = new Date(now.getTime() - _lastSync);  
    _pop.connect();  
    try {  
        ...  
    } finally {  
        _pop.disconnect();  
    }  
}
```
