Reading for This Module

- FCG Chapter 7 Viewing
- FCG Section 6.3.1 Windowing Transforms
- RB rest of Chap Viewing
- RB rest of App Homogeneous Coords
- RB Chap Selection and Feedback
- RB Sec Object Selection Using the Back Buffer
 - (in Chap Now That You Now)

Viewing

2

- ### Using Transformations
- three ways
 - modelling transforms
 - place objects within scene (shared world)
 - affine transformations
 - viewing transforms
 - place camera
 - rigid body transformations: rotate, translate
 - projection transforms
 - change type of camera
 - projective transformation

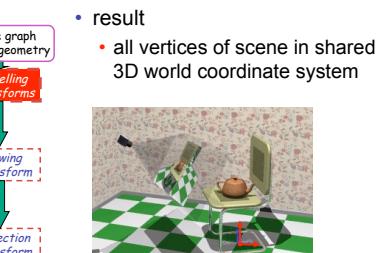

4

Rendering Pipeline

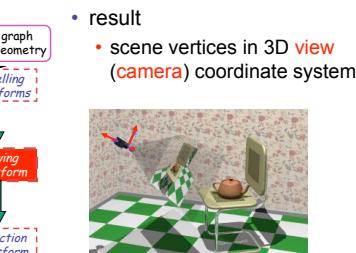

5

Rendering Pipeline

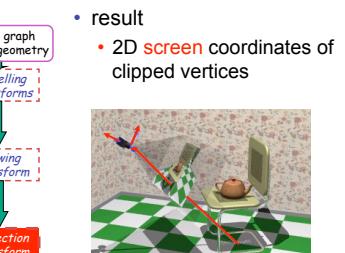

6

Rendering Pipeline

7

Rendering Pipeline

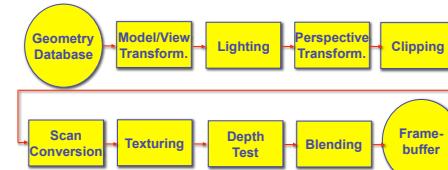

8

Viewing and Projection

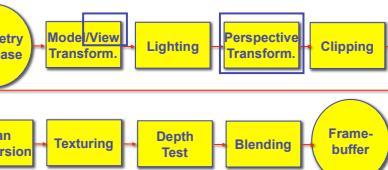

- need to get from 3D world to 2D image
- projection: geometric abstraction
 - what eyes or cameras do
- two pieces
 - viewing transform:
 - where is the camera, what is it pointing at?
 - perspective transform: 3D to 2D
 - flatten to image

Rendering Pipeline

9

Rendering Pipeline

10

OpenGL Transformation Storage

- modeling and viewing stored together
 - possible because no intervening operations
- perspective stored in separate matrix
- specify which matrix is target of operations
 - common practice: return to default modelview mode after doing projection operations

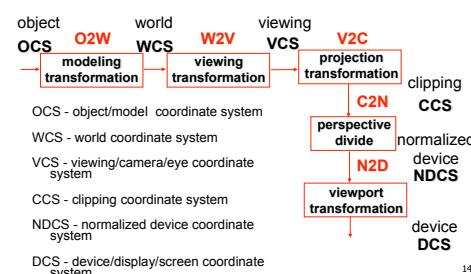

```
glMatrixMode(GL_MODELVIEW);  
glMatrixMode(GL_PROJECTION);
```

12

Coordinate Systems

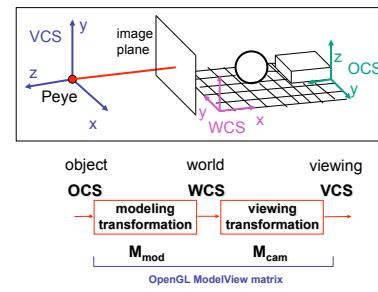

- result of a transformation
- names
 - convenience
 - animal: leg, head, tail
 - standard conventions in graphics pipeline
 - object/modelling
 - world
 - camera/viewing/eye
 - screen/window
 - raster/device

Projective Rendering Pipeline

13

Viewing Transformation

14

Basic Viewing

- starting spot - OpenGL
 - camera at world origin
 - probably inside an object
 - y axis is up
 - looking down negative z axis
 - why? RHS with x horizontal, y vertical, z out of screen
 - translate backward so scene is visible
 - move distance d = focal length
 - where is camera in P1 template code?
 - 5 units back, looking down -z axis

16

Convenient Camera Motion

- rotate/translate/scale versus
 - eye point, gaze/lookat direction, up vector
- demo: Robins transformation, projection

17

OpenGL Viewing Transformation

```
gluLookAt(ex,ey,ez,lx,ly,lz,ux,uy,uz)

• postmultiplies current matrix, so to be safe:

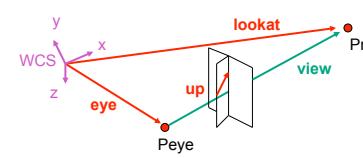

glMatrixMode(GL_MODELVIEW);
glLoadIdentity();
gluLookAt(ex,ey,ez,lx,ly,lz,ux,uy,uz)
// now ok to do model transformations

• demo: Nate Robins tutorial projection
```

18

Convenient Camera Motion

- rotate/translate/scale versus
 - eye point, gaze/lookat direction, up vector

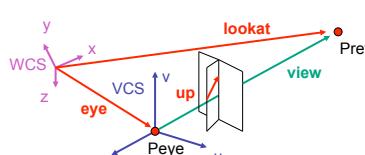

19

Deriving V2W Transformation

- translate origin to eye

$$\mathbf{T} = \begin{bmatrix} 1 & 0 & 0 & e_x \\ 0 & 1 & 0 & e_y \\ 0 & 0 & 1 & e_z \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

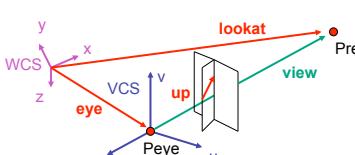

21

Deriving V2W Transformation

- rotate view vector (lookat - eye) to w axis
 - w: normalized opposite of view/gaze vector g

$$\mathbf{w} = -\hat{\mathbf{g}} = -\frac{\mathbf{g}}{\|\mathbf{g}\|}$$

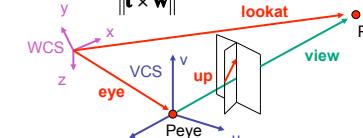

22

Deriving V2W Transformation

- rotate around w to bring up into vw-plane
 - u should be perpendicular to vw-plane, thus perpendicular to w and up vector t
 - v should be perpendicular to u and w

$$\mathbf{u} = \frac{\mathbf{t} \times \mathbf{w}}{\|\mathbf{t} \times \mathbf{w}\|} \quad \mathbf{v} = \mathbf{w} \times \mathbf{u}$$

23

Deriving V2W Transformation

- rotate from WCS xyz into uvw coordinate system with matrix that has columns u, v, w

$$\mathbf{u} = \frac{\mathbf{t} \times \mathbf{w}}{\|\mathbf{t} \times \mathbf{w}\|} \quad \mathbf{v} = \mathbf{w} \times \mathbf{u} \quad \mathbf{w} = -\hat{\mathbf{g}} = -\frac{\mathbf{g}}{\|\mathbf{g}\|}$$

$$\mathbf{T} = \begin{bmatrix} 1 & 0 & 0 & e_x \\ 0 & 1 & 0 & e_y \\ 0 & 0 & 1 & e_z \\ 0 & 0 & 0 & 1 \end{bmatrix} \quad \mathbf{R} = \begin{bmatrix} u_x & v_x & w_x & 0 \\ u_y & v_y & w_y & 0 \\ u_z & v_z & w_z & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \quad \mathbf{M}_{V2W} = \mathbf{TR}$$

- reminder: rotate from uvw to xyz coord sys with matrix M that has columns u,v,w

24

V2W vs. W2V

$$\mathbf{M}_{V2W} = \mathbf{TR}$$

$$\mathbf{T} = \begin{bmatrix} 1 & 0 & 0 & e_x \\ 0 & 1 & 0 & e_y \\ 0 & 0 & 1 & e_z \\ 0 & 0 & 0 & 1 \end{bmatrix} \quad \mathbf{R} = \begin{bmatrix} u_x & v_x & w_x & 0 \\ u_y & v_y & w_y & 0 \\ u_z & v_z & w_z & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

- we derived position of camera as object in world
 - invert for gluLookAt: go from world to camera!

$$\mathbf{M}_{W2V} = (\mathbf{M}_{V2W})^{-1} = \mathbf{R}^{-1} \mathbf{T}^{-1}$$

$$\mathbf{R}^{-1} = \begin{bmatrix} u_x & u_y & u_z & 0 \\ v_x & v_y & v_z & 0 \\ w_x & w_y & w_z & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \quad \mathbf{T}^{-1} = \begin{bmatrix} 1 & 0 & 0 & -e_x \\ 0 & 1 & 0 & -e_y \\ 0 & 0 & 1 & -e_z \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

- inverse is transpose for orthonormal matrices
- inverse is negative for translations

25

V2W vs. W2V

$$\mathbf{M}_{W2V} = (\mathbf{M}_{V2W})^{-1} = \mathbf{R}^{-1} \mathbf{T}^{-1}$$

$$\mathbf{M}_{\text{world2view}} = \begin{bmatrix} u_x & u_y & u_z & 0 \\ v_x & v_y & v_z & 0 \\ w_x & w_y & w_z & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \quad \mathbf{M}_{\text{view2world}} = \begin{bmatrix} u_x & u_y & u_z & -e_x \\ v_x & v_y & v_z & -e_y \\ w_x & w_y & w_z & -e_z \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$\mathbf{M}_{\text{W2V}} = \begin{bmatrix} u_x & u_y & u_z & -e_x * u_x + -e_y * u_y + -e_z * u_z \\ v_x & v_y & v_z & -e_x * v_x + -e_y * v_y + -e_z * v_z \\ w_x & w_y & w_z & -e_x * w_x + -e_y * w_y + -e_z * w_z \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

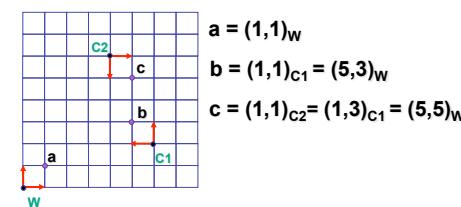

26

Moving the Camera or the World?

- two equivalent operations
 - move camera one way vs. move world other way
- example
 - initial OpenGL camera: at origin, looking along -z axis
 - create a unit square parallel to camera at z = -10
 - translate in z by 3 possible in two ways
 - camera moves to z = -3
 - Note OpenGL models viewing in left-hand coordinates
 - camera stays put, but world moves to -7
 - resulting image same either way
 - possible difference: are lights specified in world or view coordinates?

27

World vs. Camera Coordinates Example

28

Projections I

Pinhole Camera

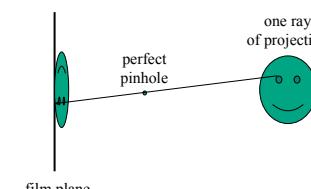

- ingredients
 - box, film, hole punch
- result
 - picture

30

Pinhole Camera

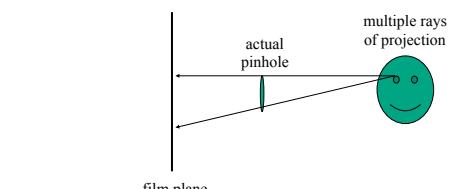

- theoretical perfect pinhole
 - light shining through tiny hole into dark space yields upside-down picture

31

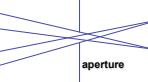

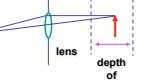

Pinhole Camera

- non-zero sized hole
 - blur: rays hit multiple points on film plane

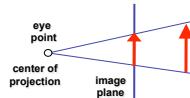

32

Real Cameras

- pinhole camera has small **aperture** (lens opening)
 - minimize blur
 - problem: hard to get enough light to expose the film
 - solution: lens
 - permits larger apertures
 - permits changing distance to film plane without actually moving it
 - cost: limited depth of field where image is in focus
- 
- 
- http://en.wikipedia.org/wiki/Image:DOF-ShallowDepthField.jpg

33

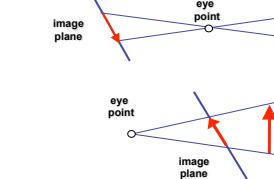

Graphics Cameras

- real pinhole camera: image inverted
 - computer graphics camera: convenient equivalent
- 
- 

34

General Projection

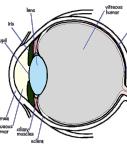

- image plane need not be perpendicular to view plane

35

Perspective Projection

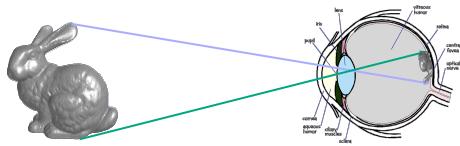

- our camera must model perspective

36

Perspective Projection

- our camera must model perspective

37

Projective Transformations

- planar geometric projections
 - planar: onto a plane
 - geometric: using straight lines
 - projections: 3D \rightarrow 2D
- aka projective mappings
- counterexamples?

38

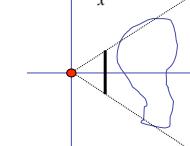

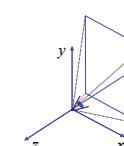

Projective Transformations

- properties
 - lines mapped to lines and triangles to triangles
 - parallel lines do **NOT** remain parallel
 - e.g. rails vanishing at infinity
 - affine combinations are **NOT** preserved
 - e.g. center of a line does not map to center of projected line (perspective foreshortening)
- 

39

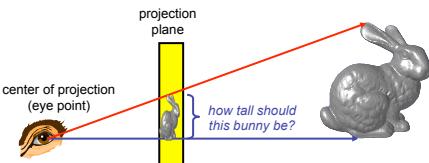

Perspective Projection

- project all geometry
 - through common center of projection (eye point)
 - onto an image plane

40

Perspective Projection

41

Basic Perspective Projection

similar triangles

$$\frac{y'}{d} = \frac{y}{z} \Rightarrow y' = \frac{y \cdot d}{z}$$

$$\frac{x'}{d} = \frac{x}{z} \Rightarrow x' = \frac{x \cdot d}{z} \quad \text{but} \quad z' = d$$

- nonuniform foreshortening
- not affine

42

Perspective Projection

- desired result for a point $[x, y, z, 1]^T$ projected onto the view plane:
- $$\frac{x'}{d} = \frac{x}{z}, \quad \frac{y'}{d} = \frac{y}{z}$$
- $$x' = \frac{x \cdot d}{z} = \frac{x}{z/d}, \quad y' = \frac{y \cdot d}{z} = \frac{y}{z/d}, \quad z' = d$$
- what could a matrix look like to do this?

43

Simple Perspective Projection Matrix

$$\begin{bmatrix} x \\ z/d \\ y \\ z/d \\ d \end{bmatrix}$$

44

Simple Perspective Projection Matrix

$$\begin{bmatrix} x \\ z/d \\ y \\ z/d \\ d \end{bmatrix}$$

is homogenized version of $\begin{bmatrix} x \\ y \\ z \\ d \end{bmatrix}$
where $w = z/d$

Simple Perspective Projection Matrix

$$\begin{bmatrix} x \\ z/d \\ y \\ z/d \\ d \end{bmatrix}$$

is homogenized version of $\begin{bmatrix} x \\ y \\ z \\ d \end{bmatrix}$
where $w = z/d$

$$\begin{bmatrix} x \\ y \\ z \\ z/d \\ d \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & 0 & | & x \\ 0 & 1 & 0 & 0 & | & y \\ 0 & 0 & 1 & 0 & | & z \\ 0 & 0 & 1/d & 0 & | & 1 \end{bmatrix}$$

45

46

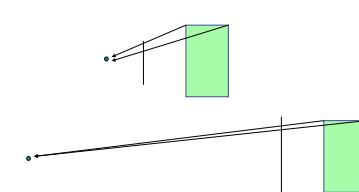

Perspective Projection

- expressible with 4x4 homogeneous matrix
 - use previously untouched bottom row
- perspective projection is irreversible
 - many 3D points can be mapped to same (x, y, d) on the projection plane
 - no way to retrieve the unique z values

47

Moving COP to Infinity

- as COP moves away, lines approach parallel
- when COP at infinity, **orthographic** view

48

Orthographic Camera Projection

- camera's back plane parallel to lens
- infinite focal length
- no perspective convergence

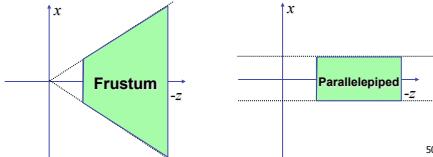

$$\begin{bmatrix} x_p \\ y_p \\ z_p \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

just throw away z values

49

Perspective to Orthographic

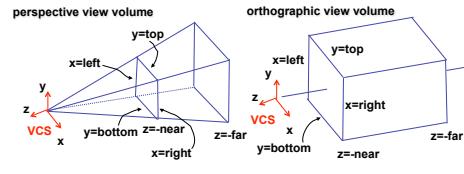

- transformation of space
- center of projection moves to infinity
- view volume transformed
 - from frustum (truncated pyramid) to parallelepiped (box)

50

View Volumes

- specifies field-of-view, used for clipping
- restricts domain of z stored for visibility test

51

Why Canonical View Volumes?

- permits standardization
- clipping
 - easier to determine if an arbitrary point is enclosed in volume with canonical view volume vs. clipping to six arbitrary planes
- rendering
 - projection and rasterization algorithms can be reused

53

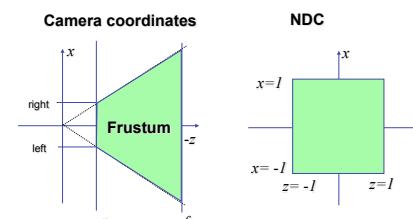

Normalized Device Coordinates

- convention
 - viewing frustum mapped to specific parallelepiped
 - Normalized Device Coordinates (NDC)
 - same as clipping coords
- only objects inside the parallelepiped get rendered
- which parallelepiped?
 - depends on rendering system

54

Normalized Device Coordinates

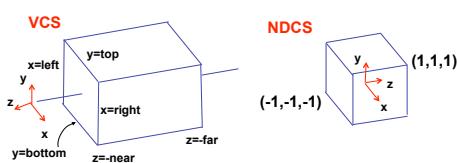

left/right $x = +/- 1$, top/bottom $y = +/- 1$, near/far $z = +/- 1$

55

Understanding Z

- z axis flip changes coord system handedness
 - RHS before projection (eye/view coords)
 - LHS after projection (clip, norm device coords)

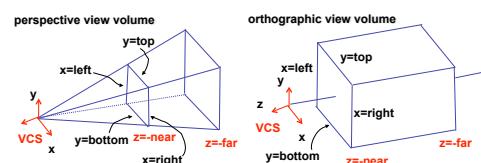

56

Understanding Z

near, far always positive in OpenGL calls

```
glOrtho(left,right,top,bottom,near,far);
glFrustum(left,right,top,bottom,near,far);
glPerspective(fovy,aspect,near,far);
```

57

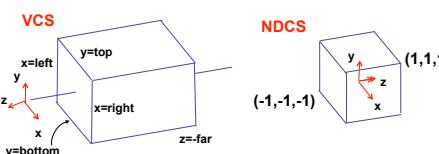

Understanding Z

- why near and far plane?
 - near plane:
 - avoid singularity (division by zero, or very small numbers)
 - far plane:
 - store depth in fixed-point representation (integer), thus have to have fixed range of values (0...1)
 - avoid/reduce numerical precision artifacts for distant objects

58

Orthographic Derivation

- scale, translate, reflect for new coord sys

59

Orthographic Derivation

- scale, translate, reflect for new coord sys

$$y' = a \cdot y + b \quad y = \text{top} \rightarrow y' = 1 \quad 1 = a \cdot \text{top} + b$$

$$y = \text{bot} \rightarrow y' = -1 \quad -1 = a \cdot \text{bot} + b$$

$$b = 1 - a \cdot \text{top}, b = -1 - a \cdot \text{bot}$$

$$1 - a \cdot \text{top} = -1 - a \cdot \text{bot}$$

$$1 - (-1) = -a \cdot \text{bot} - (-a \cdot \text{top})$$

$$2 = a(-\text{bot} + \text{top})$$

$$a = \frac{2}{\text{top} - \text{bot}}$$

$$b = -\frac{\text{top} + \text{bot}}{\text{top} - \text{bot}}$$

$$b = \frac{(\text{top} - \text{bot}) - 2 \cdot \text{top}}{\text{top} - \text{bot}}$$

$$b = \frac{-\text{top} - \text{bot}}{\text{top} - \text{bot}}$$

60

Orthographic Derivation

- scale, translate, reflect for new coord sys

$$y' = a \cdot y + b \quad y = \text{top} \rightarrow y' = 1 \quad 1 = a \cdot \text{top} + b$$

$$y = \text{bot} \rightarrow y' = -1 \quad -1 = a \cdot \text{bot} + b$$

$$b = 1 - a \cdot \text{top}, b = -1 - a \cdot \text{bot}$$

$$1 - a \cdot \text{top} = -1 - a \cdot \text{bot}$$

$$1 - (-1) = -a \cdot \text{bot} - (-a \cdot \text{top})$$

$$2 = a(-\text{bot} + \text{top})$$

$$a = \frac{2}{\text{top} - \text{bot}}$$

$$b = -\frac{\text{top} - \text{bot}}{\text{top} - \text{bot}}$$

61

Orthographic Derivation

- scale, translate, reflect for new coord sys

$$y' = a \cdot y + b \quad y = \text{top} \rightarrow y' = 1 \quad 1 = a \cdot \text{top} + b$$

$$y = \text{bot} \rightarrow y' = -1 \quad -1 = a \cdot \text{bot} + b$$

$$b = 1 - a \cdot \text{top}, b = -1 - a \cdot \text{bot}$$

$$1 - a \cdot \text{top} = -1 - a \cdot \text{bot}$$

$$1 - (-1) = -a \cdot \text{bot} - (-a \cdot \text{top})$$

$$2 = a(-\text{bot} + \text{top})$$

$$a = \frac{2}{\text{top} - \text{bot}}$$

$$b = -\frac{\text{top} - \text{bot}}{\text{top} - \text{bot}}$$

same idea for right/left, far/near

62

Orthographic Derivation

- scale, translate, reflect for new coord sys

$$P = \begin{bmatrix} \frac{2}{right-left} & 0 & 0 & -\frac{right+left}{right-left} \\ 0 & \frac{2}{top-bot} & 0 & -\frac{top+bot}{top-bot} \\ 0 & 0 & \frac{-2}{far-near} & -\frac{far+near}{far-near} \\ 0 & 0 & 0 & 1 \end{bmatrix} P$$

63

Orthographic Derivation

- scale, translate, reflect for new coord sys

$$P = \begin{bmatrix} \frac{2}{right-left} & 0 & 0 & -\frac{right+left}{right-left} \\ 0 & \frac{2}{top-bot} & 0 & -\frac{top+bot}{top-bot} \\ 0 & 0 & \frac{-2}{far-near} & -\frac{far+near}{far-near} \\ 0 & 0 & 0 & 1 \end{bmatrix} P$$

64

Orthographic Derivation

- scale, translate, reflect for new coord sys

$$P = \begin{bmatrix} \frac{2}{right-left} & 0 & 0 & \frac{right+left}{right-left} \\ 0 & \frac{2}{top-bot} & 0 & \frac{top+bot}{top-bot} \\ 0 & 0 & \frac{-2}{far-near} & \frac{far+near}{far-near} \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

65

Orthographic Derivation

- scale, translate, reflect for new coord sys

$$P = \begin{bmatrix} \frac{2}{right-left} & 0 & 0 & \frac{right+left}{right-left} \\ 0 & \frac{2}{top-bot} & 0 & \frac{top+bot}{top-bot} \\ 0 & 0 & \frac{-2}{far-near} & \frac{far+near}{far-near} \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

66

Orthographic OpenGL

```
glMatrixMode(GL_PROJECTION);
glLoadIdentity();
glOrtho(left,right,bot,top,near,far);
```

67

Demo

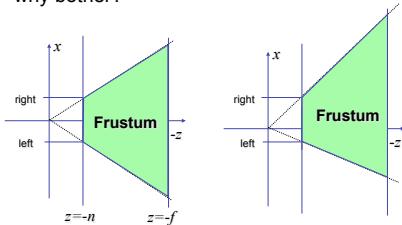

- Brown applets: viewing techniques
 - parallel/orthographic cameras
 - projection cameras
- http://www.cs.brown.edu/exploratories/freeSoftware/catalogs/viewing_techniques.html

68

Projections II

Asymmetric Frusta

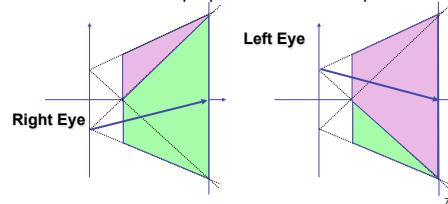

- our formulation allows asymmetry
- why bother?

69

Asymmetric Frusta

- our formulation allows asymmetry
- why bother? binocular stereo
 - view vector not perpendicular to view plane

70

71

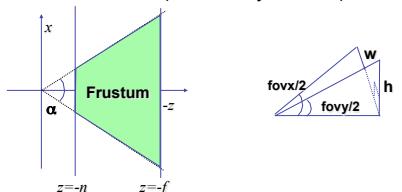

Simpler Formulation

- left, right, bottom, top, near, far
 - nonintuitive
 - often overkill
- look through window center
 - symmetric frustum
- constraints
 - left = -right, bottom = -top

72

Field-of-View Formulation

- FOV in one direction + aspect ratio (w/h)
 - determines FOV in other direction
 - also set near, far (reasonably intuitive)

73

Perspective OpenGL

```
glMatrixMode(GL_PROJECTION);
glLoadIdentity();

glFrustum(left,right,bot,top,near,far);
or
glPerspective(fovy,aspect,near,far);
```

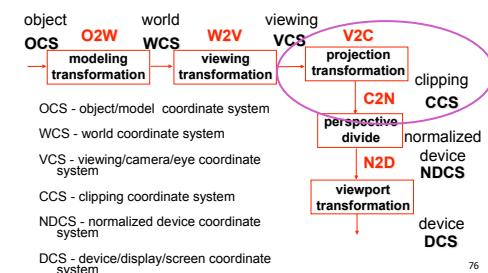

74

Demo: Frustum vs. FOV

- Nate Robins tutorial (take 2):
 - <http://www.xmission.com/~nate/tutors.html>

75

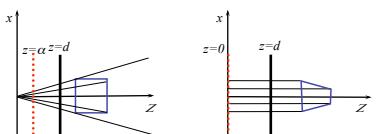

Projective Rendering Pipeline

76

Projection Warp

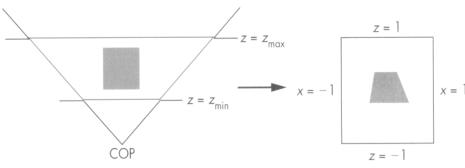

- warp perspective view volume to orthogonal view volume
 - render all scenes with orthographic projection!
 - aka perspective warp

77

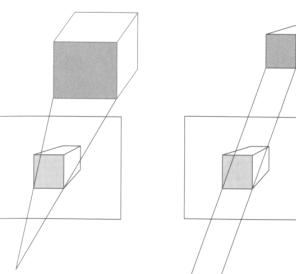

Perspective Warp

- perspective viewing frustum transformed to cube
- orthographic rendering of cube produces same image as perspective rendering of original

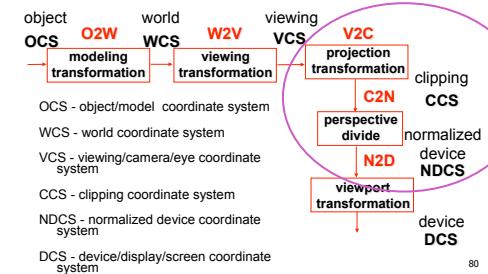

78

Predistortion

79

Projective Rendering Pipeline

80

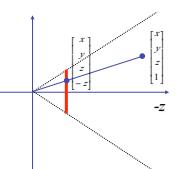

Separate Warp From Homogenization

- viewing VCS **V2C** clipping CCS **C2N** normalized device NDCS
- projection transformation alter w
- perspective division / w
- warp requires only standard matrix multiply
- distort such that orthographic projection of distorted objects is desired persp projection
 - w is changed
- clip after warp, before divide
- division by w: homogenization

81

Perspective Divide Example

- specific example
- assume image plane at $z = -1$
- a point $[x, y, z, I]^T$ projects to $[-x/z, -y/z, -z/z, I]^T = [x, y, z, -z]^T$

82

Perspective Divide Example

$$T \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & -1 & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} = \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} = \begin{bmatrix} -x/z \\ -y/z \\ -z/z \\ 1 \end{bmatrix} = \begin{bmatrix} -x/z \\ -y/z \\ -1 \\ 1 \end{bmatrix}$$

- after homogenizing, once again $w=1$

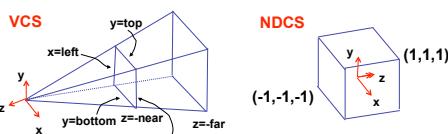

83

Demo

- Brown applets: viewing techniques
 - parallel/orthographic cameras
 - projection cameras
- http://www.cs.brown.edu/exploratories/freeSoftware/catalogs/viewing_techniques.html

81

Perspective To NDCS Derivation

85

Perspective Derivation

simple example earlier:

$$\begin{bmatrix} x' \\ y' \\ z' \\ w' \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 1/d & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

- complete: shear, scale, projection-normalization

$$\begin{bmatrix} x' \\ y' \\ z' \\ w' \end{bmatrix} = \begin{bmatrix} E & 0 & A & 0 \\ 0 & F & B & 0 \\ 0 & 0 & C & D \\ 0 & 0 & -1 & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

86

Perspective Derivation

earlier:

$$\begin{bmatrix} x' \\ y' \\ z' \\ w' \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 1/d & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

- complete: shear, scale, projection-normalization

$$\begin{bmatrix} x' \\ y' \\ z' \\ w' \end{bmatrix} = \begin{bmatrix} E & 0 & A & 0 \\ 0 & F & B & 0 \\ 0 & 0 & C & D \\ 0 & 0 & -1 & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

88

Perspective Derivation

earlier:

$$\begin{bmatrix} x' \\ y' \\ z' \\ w' \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 1/d & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

complete: shear, scale, projection-normalization

$$\begin{bmatrix} x' \\ y' \\ z' \\ w' \end{bmatrix} = \begin{bmatrix} E & 0 & A & 0 \\ 0 & F & B & 0 \\ 0 & 0 & C & D \\ 0 & 0 & -1 & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

85

Recorrection: Perspective Derivation

L/R sign error

$$\begin{bmatrix} x' \\ y' \\ z' \\ w' \end{bmatrix} = \begin{bmatrix} E & 0 & A & 0 \\ 0 & F & B & 0 \\ 0 & 0 & C & D \\ 0 & 0 & -1 & 0 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix}$$

$x' = Ex + Az$
 $y' = Fy + Bz$
 $z' = Cz + D$
 $w' = -z$

$x = left \rightarrow x'/w' = -1$
 $x = right \rightarrow x'/w' = 1$
 $y = top \rightarrow y'/w' = 1$
 $y = bottom \rightarrow y'/w' = -1$
 $z = near \rightarrow z'/w' = -1$
 $z = far \rightarrow z'/w' = 1$

Z axis flip!

$$y' = Fy + Bz, \quad y' = \frac{Fy + Bz}{w'}, \quad 1 = \frac{Fy + Bz}{w'}, \quad 1 = \frac{Fy + Bz}{-z},$$

$$1 = F\frac{y}{-z} + B\frac{z}{-z}, \quad 1 = F\frac{y}{-z} - B, \quad 1 = F\frac{top}{-(near)} - B,$$

$$1 = F\frac{top}{near} - B$$

90

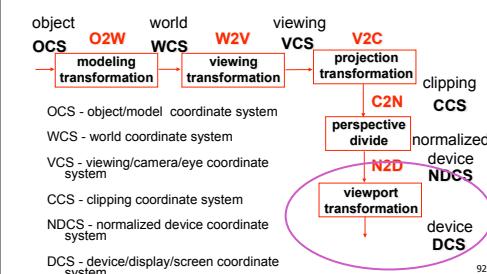

Perspective Derivation

- similarly for other 5 planes
- 6 planes, 6 unknowns

$$\begin{bmatrix} 2n & 0 & r+l & 0 \\ r-l & 2n & r-l & 0 \\ 0 & t-b & t-b & 0 \\ 0 & 0 & -(f+n) & -2fn \\ 0 & 0 & f-n & f-n \\ 0 & 0 & -1 & 0 \end{bmatrix}$$

91

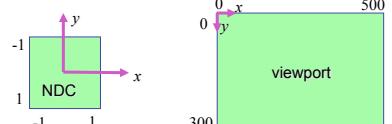

Projective Rendering Pipeline

92

NDC to Device Transformation

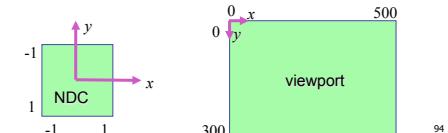

- map from NDC to pixel coordinates on display
- NDC range is $x = -1\dots 1$, $y = -1\dots 1$, $z = -1\dots 1$
- typical display range: $x = 0\dots 500$, $y = 0\dots 300$
 - maximum is size of actual screen
 - z range max and default is $(0, 1)$, use later for visibility
- `glViewport(0,0,w,h); glDepthRange(0,1); // depth = 1 by default`

93

Origin Location

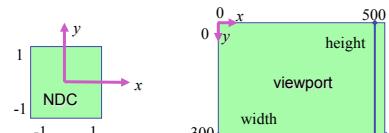

- yet more (possibly confusing) conventions
 - OpenGL origin: lower left
 - most window systems origin: upper left
- then must reflect in y
- when interpreting mouse position, have to flip your y coordinates

94

N2D Transformation

- general formulation
 - reflect in y for upper vs. lower left origin
 - scale by width, height, depth
 - translate by width/2, height/2, depth/2
 - FCG includes additional translation for pixel centers at (.5, .5) instead of (0,0)

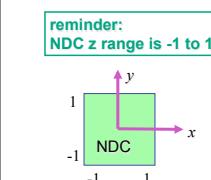

95

N2D Transformation

$$\begin{bmatrix} x_p \\ y_p \\ z_p \\ 1 \end{bmatrix} = \begin{bmatrix} 1 & 0 & 0 & \frac{width}{2} \\ 0 & 1 & 0 & \frac{height}{2} \\ 0 & 0 & 1 & \frac{depth}{2} \\ 0 & 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ 1 \end{bmatrix} = \begin{bmatrix} \frac{width(x+1)-1}{2} \\ \frac{height(y+1)-1}{2} \\ \frac{depth(z+1)-1}{2} \\ 1 \end{bmatrix}$$

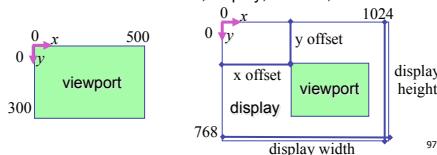

Display z range is 0 to 1.
`glDepthRange(n,f)` can constrain further, but $depth = 1$ is both max and default

96

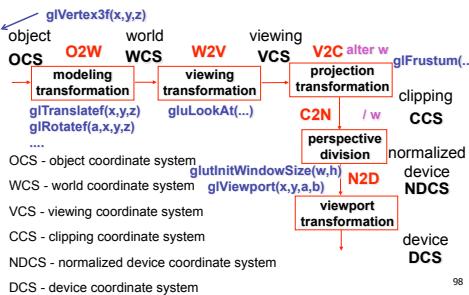

Device vs. Screen Coordinates

- viewport/window location wrt actual display not available within OpenGL
 - usually don't care
 - use relative information when handling mouse events, not absolute coordinates
 - could get actual display height/width, window offsets from OS

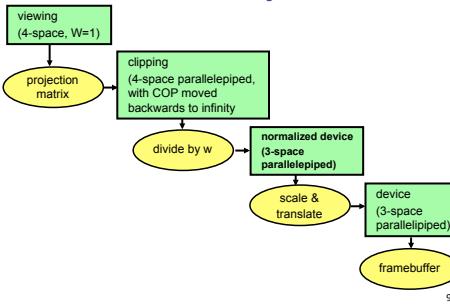

97

Projective Rendering Pipeline

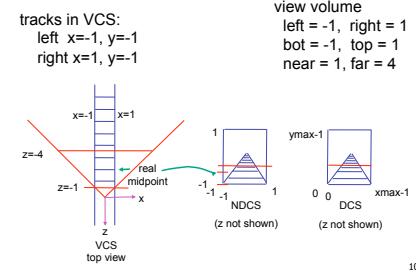

98

Coordinate Systems

99

Perspective Example

100

Perspective Example

- view volume
 - left = -1, right = 1
 - bot = -1, top = 1
 - near = 1, far = 4

$$\begin{bmatrix} \frac{2n}{r-l} & 0 & \frac{r+l}{r-l} & 0 \\ 0 & \frac{2n}{t-b} & \frac{t+b}{t-b} & 0 \\ 0 & 0 & \frac{-(f+n)}{f-n} & \frac{-2fn}{f-n} \\ 0 & 0 & -1 & 0 \end{bmatrix} \begin{bmatrix} 1 & 0 & 0 & 0 \\ 0 & 1 & 0 & 0 \\ 0 & 0 & -5/3 & -8/3 \\ 0 & 0 & -1 & 0 \end{bmatrix} \begin{bmatrix} 1 \\ -1 \\ -5z_{VCS}/3 - 8/3 \\ -z_{VCS} \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ -5/3 - 8/3 \\ -1 \end{bmatrix} z_{VCS}$$

101

Perspective Example

$$\begin{bmatrix} 1 \\ -1 \\ -5z_{VCS}/3 - 8/3 \\ -z_{VCS} \end{bmatrix} = \begin{bmatrix} 1 \\ 1 \\ -5/3 - 8/3 \\ -1 \end{bmatrix} z_{VCS}$$

/ w

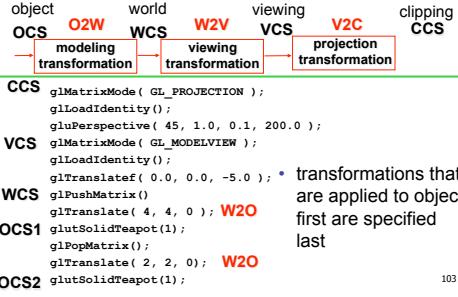

$$x_{NDCS} = -1/z_{VCS}$$

$$y_{NDCS} = 1/z_{VCS}$$

$$z_{NDCS} = \frac{5}{3} + \frac{8}{3z_{VCS}}$$

102

OpenGL Example

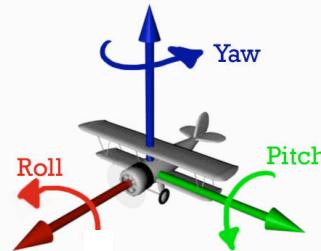

103

Reading for Next Time

- RB Chap Color
- FCG Sections 3.2-3.3
- FCG Chap 20 Color
- FCG Chap 21.2.2 Visual Perception (Color)

104

Viewing: More Camera Motion

105

Viewing: Incremental Relative Motion

- how to move relative to current camera coordinate system?
 - what you see in the window
- computation in coordinate system used to draw previous frame is simple:
 - incremental change I to current C
 - at time k, want p' = |k|k-1k-2k-3 ... |5|4|3|2|1Cp
- each time we just want to premultiply by new matrix
 - p'=Cp
 - but we know that OpenGL only supports postmultiply by new matrix
 - p=Cp

106

Viewing: Incremental Relative Motion

- sneaky trick: OpenGL modelview matrix has the info we want!
 - dump out modelview matrix [from previous frame](#) with `glGetDoublev()`
 - C = current camera coordinate matrix
 - wipe the matrix stack with `glLoadIdentity()`
 - apply incremental update matrix I
 - apply current camera coord matrix C
- must leave the modelview matrix unchanged by object transformations after your display call
 - use push/pop
 - using OpenGL for storage and calculation
 - querying pipeline is expensive
 - but safe to do just once per frame

107

Caution: OpenGL Matrix Storage

- OpenGL internal matrix storage is columnwise, not rowwise

a e i m

b f j n

c g k o

d h l p

opposite of standard C/C++/Java convention

possibly confusing if you look at the matrix from `glGetDoublev()`!

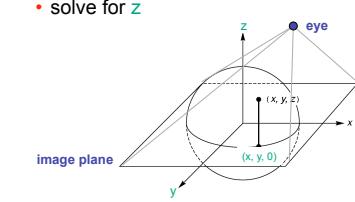

Viewing: Virtual Trackball

- interface for spinning objects around
 - drag mouse to control rotation of view volume
 - orbit/spin metaphor
 - vs. flying/driving
- rolling glass trackball
 - center at screen origin, surrounds world
 - hemisphere "sticks up" in z, out of screen
 - rotate ball = spin world

109

Clarify: Virtual Trackball

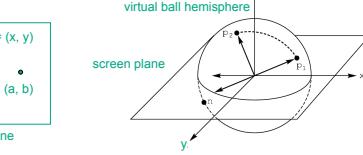

- know screen click: $(x, y, 0)$
- want to infer point on trackball: (x, y, z)
 - ball is unit sphere, so $\|x, y, z\| = 1.0$
 - solve for z

110

Clarify: Trackball Rotation

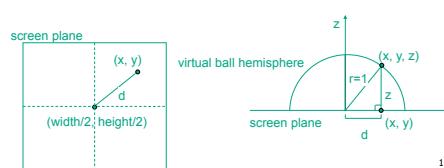

- user drags between two points on image plane
 - mouse down at $i_1 = (x, y)$, mouse up at $i_2 = (a, b)$
 - find corresponding points on virtual ball
 - $p_1 = (x, y, z)$, $p_2 = (a, b, c)$
- compute rotation angle and axis for ball
 - axis of rotation is plane normal: cross product $p_1 \times p_2$
 - amount of rotation θ from angle between lines
 - $\theta = p_1 \cdot p_2 = \|p_1\| \|p_2\| \cos \theta$

111

Clarify: Trackball Rotation

- finding location on ball corresponding to click on image plane
- ball radius r is 1

113

Trackball Computation

- user defines two points
 - place where first clicked $p_1 = (x, y, z)$
 - place where released $p_2 = (a, b, c)$
- create plane from vectors between points, origin
 - axis of rotation is plane normal: cross product
 - $(p_1 - o) \times (p_2 - o)$: $p_1 \times p_2$ if origin = (0,0,0)
 - amount of rotation depends on angle between lines
 - $p_1 \cdot p_2 = |p_1| |p_2| \cos \theta$
 - $|p_1 \times p_2| = |p_1| |p_2| \sin \theta$
- compute rotation matrix, use to rotate world

114

Picking

- Red Book
 - Selection and Feedback Chapter
 - all
 - Now That You Know Chapter
 - only Object Selection Using the Back Buffer

115

116

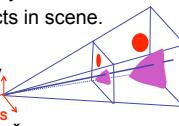

Interactive Object Selection

- move cursor over object, click
 - how to decide what is below?
 - inverse of rendering pipeline flow
 - from pixel back up to object
- ambiguity
 - many 3D world objects map to same 2D point
- four common approaches
 - manual ray intersection
 - bounding extents
 - backbuffer color coding
 - selection region with hit list

117

Manual Ray Intersection

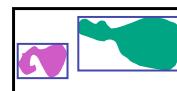

- do all computation at application level
 - map selection point to a ray
 - intersect ray with all objects in scene.
- advantages
 - no library dependence
- disadvantages
 - difficult to program
 - slow: work to do depends on total number and complexity of objects in scene

118

Bounding Extents

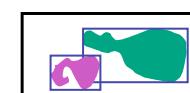

- keep track of axis-aligned bounding rectangles

119

Bounding Extents

- disadvantages
 - low precision
 - must keep track of object-rectangle relationship
- extensions
 - do more sophisticated bound bookkeeping
 - first level: box check.
 - second level: object check

120

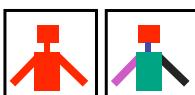

Backbuffer Color Coding

- use backbuffer for picking
 - create image as computational entity
 - never displayed to user
- redraw all objects in backbuffer
 - turn off shading calculations
 - set unique color for each pickable object
 - store in table
- read back pixel at cursor location
 - check against table

121

Backbuffer Color Coding

- advantages
 - conceptually simple
 - variable precision
- disadvantages
 - introduce 2x redraw delay
 - backbuffer readback **very slow**

122

Backbuffer Example

```
glColor3f(1.0, 1.0, 1.0);
for(int i = 0; i < 2; i++)
  for(int j = 0; j < 2; j++) {
    glPushMatrix();
    switch (i*2+j) {
      case 0: glColor3ub(255,0,0);break;
      case 1: glColor3ub(0,255,0);break;
      case 2: glColor3ub(0,0,255);break;
      case 3: glColor3ub(250,0,250);break;
    }
    glTranslatef(i*3.0,0,-j * 3.0)
    glCallList(snowman_display_list);
    glPopMatrix();
  }
  glTranslatef(i*3.0,0,-3.0)
  glCallList(snowman_display_list);
  glPopMatrix();
```

<http://www.lighthouse3d.com/opengl/picking/>

123

Select/Hit

- use small region around cursor for viewport
- assign per-object integer keys (names)
- redraw in special mode
- store hit list of objects in region
- examine hit list
- OpenGL support

124

Viewport

- small rectangle around cursor
 - change coord sys so fills viewport
- why rectangle instead of point?
 - people aren't great at positioning mouse
 - Fitts' Law: time to acquire a target is function of the distance to and size of the target
 - allow several pixels of slop

125

Viewport

- nontrivial to compute
 - invert viewport matrix, set up new orthogonal projection
- simple utility command
 - gluPickMatrix(x,y,w,h,viewport)
 - x,y: cursor point
 - w,h: sensitivity/slop (in pixels)
 - push old setup first, so can pop it later

126

Render Modes

- glRenderMode(mode)
- GL_RENDER: normal color buffer
 - default
- GL_SELECT: selection mode for picking
- (GL_FEEDBACK: report objects drawn)

127

Name Stack

- again, "names" are just integers
 - glInitNames()
- flat list
 - glLoadName(name)
- or hierarchy supported by stack
 - glPushName(name), glPopName
 - can have multiple names per object

128

Hierarchical Names Example

```
for(int i = 0; i < 2; i++) {
    glPushName(i);
    for(int j = 0; j < 2; j++) {
        glPushMatrix();
        glPushName(j);
        glTranslatef("10.0.0.j * 10.0);
        glPushName(BODY);
        glCallList(snowManHeadDL);
        glLoadName(BODY);
        glCallList(snowManBodyDL);
        glPopName();
        glPopName();
        glPopMatrix();
    }
    glPopName();
}
```

<http://www.lighthouse3d.com/opengl/picking/>

129

Hit List

- glSelectBuffer(bufferSize, *buffer)
 - where to store hit list data
- on hit, copy entire contents of name stack to output buffer.
- hit record
 - number of names on stack
 - minimum and maximum depth of object vertices
 - depth lies in the NDC z range [0,1]
 - format: multiplied by 2^{32-1} then rounded to nearest int

130

Integrated vs. Separate Pick Function

- integrate: use same function to draw and pick
 - simpler to code
 - name stack commands ignored in render mode
- separate: customize functions for each
 - potentially more efficient
 - can avoid drawing unpickable objects

131

Select/Hit

- advantages
 - faster
 - OpenGL support means hardware acceleration
 - avoid shading overhead
 - flexible precision
 - size of region controllable
 - flexible architecture
 - custom code possible, e.g. guaranteed frame rate
- disadvantages
 - more complex

132

Hybrid Picking

- select/hit approach: fast, coarse
 - object-level granularity
- manual ray intersection: slow, precise
 - exact intersection point
- hybrid: both speed and precision
 - use select/hit to find object
 - then intersect ray with that object

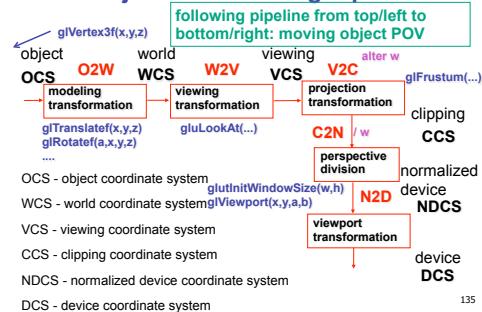

133

OpenGL Precision Picking Hints

- gluUnproject
 - transform window coordinates to object coordinates given current projection and modelview matrices
 - use to create ray into scene from cursor location
 - call gluUnProject twice with same (x,y) mouse location
 - z = near: (x,y,0)
 - z = far: (x,y,1)
 - subtract near result from far result to get direction vector for ray
 - use this ray for line/polygon intersection

134

Projective Rendering Pipeline

135

OpenGL Example

go back from end of pipeline to beginning: coord frame POV!

object	O2W	world	W2V	viewing	V2C	clipping
OCS	WCS			VCS		CCS
modeling transformation	viewing transformation			projection transformation		clipping transformation

CCS

```
glMatrixMode( GL_PROJECTION );
glLoadIdentity();
gluPerspective( 45, 1.0, 0.1, 200.0 );
VCS
glMatrixMode( GL_MODELVIEW );
glLoadIdentity();
glTranslatef( 0.0, 0.0, -5.0 );  
W2V
WCS
glPushMatrix()
glTranslatef( 4, 4, 0 ); W2O
OCS1
glutSolidTeapot();
glPopMatrix();
glTranslatef( 2, 2, 0 ); W2O
OCS2
glutSolidTeapot();
```

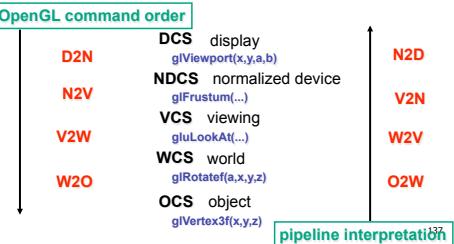

136

- transformations that are applied to object first are specified last

Coord Sys: Frame vs Point

read down: transforming between coordinate frames, from frame A to frame B

read up: transforming points, up from frame B coords to frame A coords

138

Coord Sys: Frame vs Point

- is `gluLookat` viewing transformation V2W or W2V? depends on which way you read!
 - coordinate frames: V2W
 - takes you from view to world coordinate frame
 - points/objects: W2V
 - point is transformed from world to view coords when multiply by `gluLookAt` matrix
- H2 uses the object/pipeline POV
 - Q1/4 is W2V (`gluLookAt`)
 - Q2/5-6 is V2N (`glFrustum`)
 - Q3/7 is N2D (`glViewport`)
