

Vis-A-Ware: Integrating Spatial and Non-Spatial Visualization for Visibility-Aware Urban Planning.

Thomas Ortner, Johannes Sorger, Harald Steinlechner, Gerd Hesina, Harald Piringer, Eduard Groller.
IEEE TVCG 23(2):1139-1151 2017

Matthew Chun

High Level Overview

- Urban planning
 - What is the visual impact of new buildings on city scape?
 - How will it look from multiple different perspectives?
 - How can we easily compare different buildings beyond subjective perception?

2

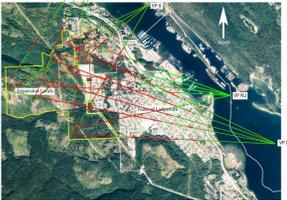

High Level Overview

- Urban planning
 - What is the visual impact of new buildings on city scape?
 - How will it look from multiple different perspectives?
 - How can we easily compare different buildings beyond subjective perception?
- Vis-A-Ware
 - Qualitative and quantitative evaluation, ranking, and comparison on the different types of "visibility" of candidate buildings from various viewpoints
 - Links together a 3D spatial urban view with non-spatial data for more context

3

Domain Practice

- Experts create visibility and landmark occlusion maps

4

Domain Practice

- Photo montages that overlay real images with virtual candidate buildings

5

Domain Practice

- 3D rendering from a few viewpoints
- Haptic models

6

Task Analysis

- With a combination of above techniques, compare candidate buildings with respect to visual impact (Current Practices)
 - Qualitative -> Potential subjective bias
 - Can only compare a few viewpoints at a time

7

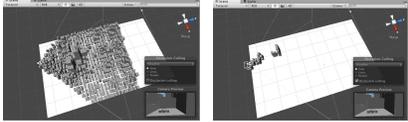

Task Analysis

- With a combination of above techniques, compare candidate buildings with respect to visual impact (Current Practices)
 - Qualitative -> Potential subjective bias
 - Can only compare a few viewpoints at a time
- Can we also compare candidate buildings in a more holistic manner? (Suggested New Practice)
 - Quantitative -> More specificity in details (eg. How occluded)
 - More comparisons possible -> Multiple viewpoints
- Is it possible to combine the current and new approaches?

Vis-A-Ware

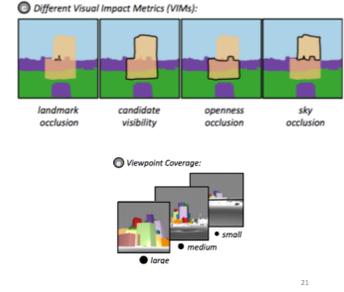

System Overview – Visual Impact Metrics (VIM)

- Coded by “false colour” -> colour that stands out in a scene
 - Landmarks are red
 - Sky is blue
 - Openness is green
 - Candidate building is orange

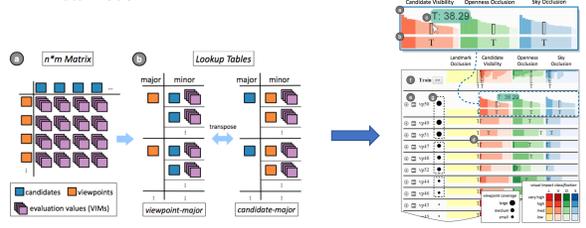

System Overview – Visual Impact Metrics (VIM)

- Coded by “false colour” -> colour that stands out in a scene
 - Landmarks are red
 - Sky is blue
 - Openness is green
 - Candidate building is orange
- To get a number, normalized on a ratio
 - # of pixels of VIM of interest/# of candidate pixels
 - Bin categories
 - Low, medium, high, very high
- How relevant is particular viewpoint?
 - all candidate pixels/total number of image pixels
 - Bin categories
 - Small, medium, high

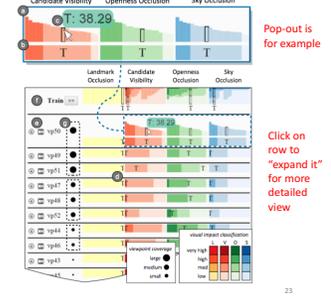

System Overview – Transposable Ranking View (TRV)

- Main way to filter, rank, compare candidates based on VIM
- Data Model

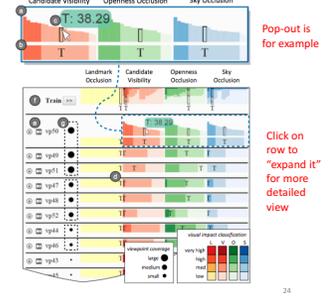

Transposable Ranking View (TRV) - Visual Encoding

- Viewpoint Major Mode
 - a) Bar charts show VIM for each candidate (letter) in distribution, saturation shows impact class

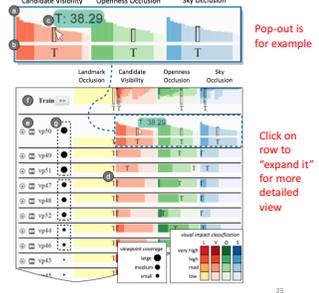

Transposable Ranking View (TRV) - Visual Encoding

- Viewpoint Major Mode
 - a) Bar charts show VIM for each candidate (letter) in distribution, saturation shows impact class
 - b) Stacked bar chart is compact rep. of bar charts

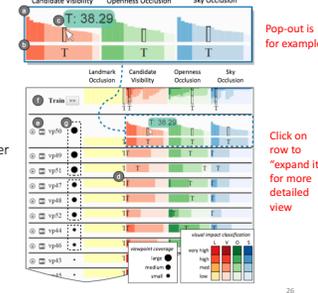

Transposable Ranking View (TRV) - Visual Encoding

- Viewpoint Major Mode
 - a) Bar charts show VIM for each candidate (letter) in distribution, saturation shows impact class
 - b) Stacked bar chart is compact rep. of bar charts
 - c) Linked peek brushing shows detail on demand and current candidate across other viewpoints (letter)

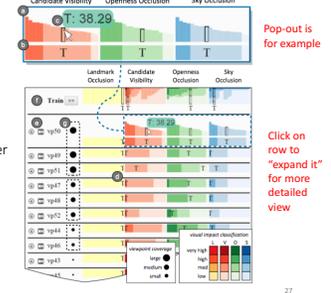

Transposable Ranking View (TRV) - Visual Encoding

- Viewpoint Major Mode
 - a) Bar charts show VIM for each candidate (letter) in distribution, saturation shows impact class
 - b) Stacked bar chart is compact rep. of bar charts
 - c) Linked peek brushing shows detail on demand and current candidate across other viewpoints (letter)
 - d) Any row that is ranked by distribution scores over all viewpoints

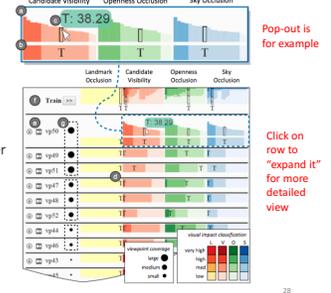

Transposable Ranking View (TRV) - Visual Encoding

- Viewpoint Major Mode
 - a) Bar charts show VIM for each candidate (letter) in distribution, saturation shows impact class
 - b) Stacked bar chart is compact rep. of bar charts
 - c) Linked peek brushing shows detail on demand and current candidate across other viewpoints (letter)
 - d) Any row that is ranked by distribution scores over all viewpoints
 - e) Arrow icon loads into spatial view of tool (Map)

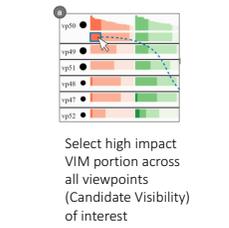

Transposable Ranking View (TRV) - Visual Encoding

- Viewpoint Major Mode
 - a) Bar charts show VIM for each candidate (letter) in distribution, saturation shows impact class
 - b) Stacked bar chart is compact rep. of bar charts
 - c) Linked peek brushing shows detail on demand and current candidate across other viewpoints (letter)
 - d) Any row that is ranked by distribution scores over all viewpoints
 - e) Arrow icon loads into spatial view of tool (Map)
 - f) A high level summary of a category of viewpoint

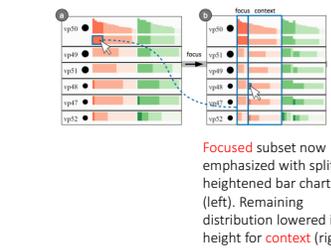

Transposable Ranking View (TRV) – Focus, Filter, Transpose Workflow Example

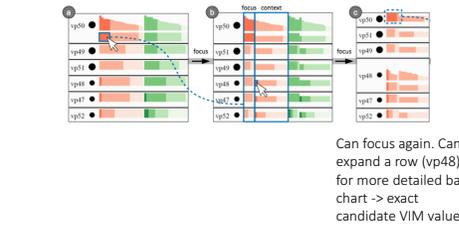

Select high impact VIM portion across all viewpoints (Candidate Visibility) of interest

Transposable Ranking View (TRV) – Focus, Filter, Transpose Workflow Example

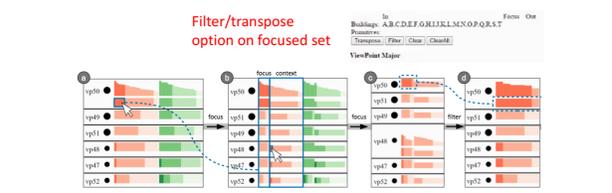

Focused subset now emphasized with split heightened bar charts (left). Remaining distribution lowered in height for context (right).

Transposable Ranking View (TRV) – Focus, Filter, Transpose Workflow Example

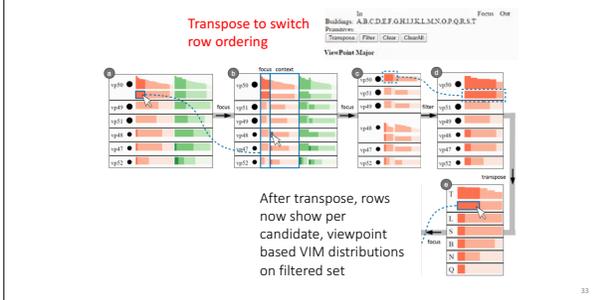

Can focus again. Can expand a row (vp48) for more detailed bar chart -> exact candidate VIM values

Transposable Ranking View (TRV) – Focus, Filter, Transpose Workflow Example

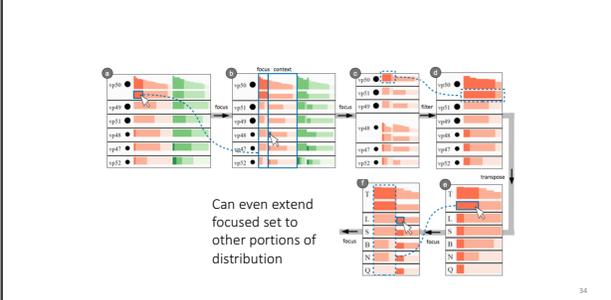

Use filter option above to see filtered viewpoint distributions now. Emphasize focused area for inspection.

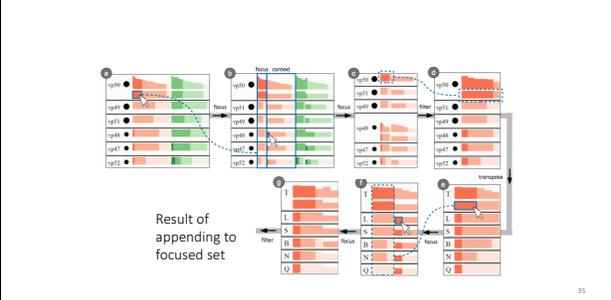

Transposable Ranking View (TRV) – Focus, Filter, Transpose Workflow Example

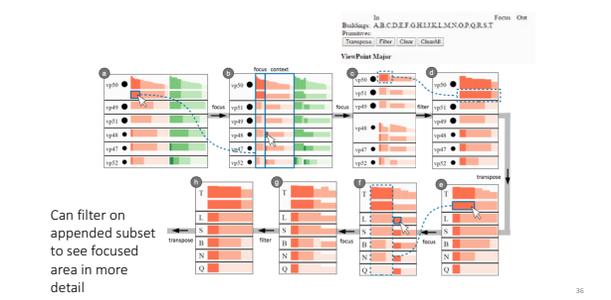

Transposable Ranking View (TRV) – Focus, Filter, Transpose Workflow Example

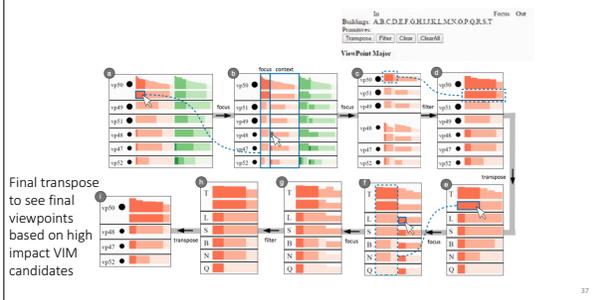

Transposable Ranking View (TRV) – Focus, Filter, Transpose Workflow Example

Transposable Ranking View (TRV) – Focus, Filter, Transpose Workflow Example

System Overview – 3D Spatial View

- City model and associated landmarks, buildings, similar to GIS
 - Candidate buildings denoted by repeating 10 colours
 - Viewpoints shown as circular glyphs
 - Size denotes how many candidates are covered
 - VIM Majority denoted by VIM colour
 - Number denotes how many candidates are covered
 - TRV Linked Highlighting
 - Only viewpoints expanded rows shown, other viewpoints are "context" (greyed out)
 - Highlighted candidate buildings rendered opaque and coloured -> compare spatial properties with other candidates visually
-

System Overview - Filmstrip

- Based on TRV loaded viewpoints/candidates
 - Show images of all candidates in one viewpoint (viewpoint major)
 - Show one candidate in all viewpoints (candidate major)
 - Header in filmstrip box shows identifier of row from TRV
 - Name and value of VIM selected as well
-

Task Analysis Example

- Which candidates cover a landmark and how strong is the occlusion?
-

User Feedback

- During development, received feedback from 10 experts
 - VIM validation only with 1 expert
- Positive reactions
 - Could see benefits of large scale viewpoint evaluation for streets
 - Liked visual linking between spatial view and VIM values
 - Most popular VIM was landmark occlusion (Vienna)
- Would have liked
 - Attribute to indicate shape of a candidate

Known Limitations

- Openness metric not clear for most
 - Use depth to quantify volume of open space occluded by candidate
- Expand TRV to other "hard criteria" eg. Max height, min. floor space, office to apartment ratio, etc
- VIM for shadow cast by candidate
- Movement profiles of a viewpoint eg. # people at a viewpoint passing through

Summary

- What: Data
 - Spatial locations of candidate buildings
 - VIM derived metrics
- How: Encode
 - Spatial 3D view -> 3D map
 - Non-spatial transposable rank view -> histograms, bar charts, stacked bar charts
- How: Reduce
 - Elide (bar height change) and filter option to chosen focus set
- Scale
 - 30 candidates tested
 - Viewpoints problematic -> suggested further filtering of viewpoints with low coverage to compensate
 - More than 4 VIM metrics could be possible

My Take

- What it did well
 - Great willingness to carry over domain techniques for familiarity with target users
 - Liked how they quantified aesthetic information for easier comparison, ranking, and filtering
 - Good use of linking between views to understand a candidate/viewpoint in terms of a VIM
- Improvements
 - Gallery view for filmstrip instead of horizontal strip area (visually compare viewpoints more at once)
 - "History" feature since filtering will eliminate previous steps, may have to go back?
 - Stronger VIM metric definitions -> get more experts
 - Ability to define viewpoint coverage criteria or other VIM metrics further (might be different and context dependent)
 - Figures not always clear, especially filter/transpose ... had to consult video to realize

Thanks for watching!
