

# Information Visualization

## Facet, Reduce, Scalable Insets

### *Ex: Complexity Families*

**Tamara Munzner**

Department of Computer Science  
University of British Columbia

**Week 5, 2 Oct 2025**

**<https://www.cs.ubc.ca/~tmm/courses/547-25>**

# Plan for today

- small group exercises
  - Complexity Families
- break
- mini-lecture / Q&A responses
  - Facet
  - Reduce
  - Scalable Insets

# Upcoming

- tomorrow (Fri Oct 3): Groups finalized by noon, tell me via Piazza post
- next week (W6)
  - to read & discuss (async, before next class)
    - VAD book, Ch 14: Embed
    - paper: TensorFlowGraph [design study]
    - paper: TBD (see Piazza)
  - in class
    - pre-proposal meetings with each team
    - project work together when I'm not meeting with your team

# In-Class Exercise

**Break: 4-4:10**

# Mini-Lecture

# Scalable Insets

# Scalable Insets

- **Pattern-Driven Navigation in 2D Multiscale Visualizations with Scalable Insets.**

Lekschas, Behrisch, Bach, Kerpedjiev, Gehlenborg, Pfister. IEEE TVCG (Proc.VIS 2019) 26(1):611 - 621, 2020

- good example for
  - multiple views
  - aggregation
- technique paper
  - idiom combines encoding & interaction

# Key ideas

- multiscale problem: things of interest too small to see from overview
  - pan & zoom (navigation), overview & detail (multiple windows), detail-in-context
  - focus+context: more on this next week (Embed)
  - highlighting
  - aggregation & simplification

# Use cases

- technique shown in three applications
  - **large-scale structural genomics matrices**
    - underlying motivation...
  - gigapixel images
  - geographic maps

# Key ideas

- framing tradeoff: locality, context, details

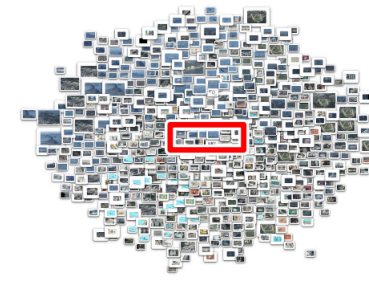

**1. Max. Locality**

**B. Max. Context**

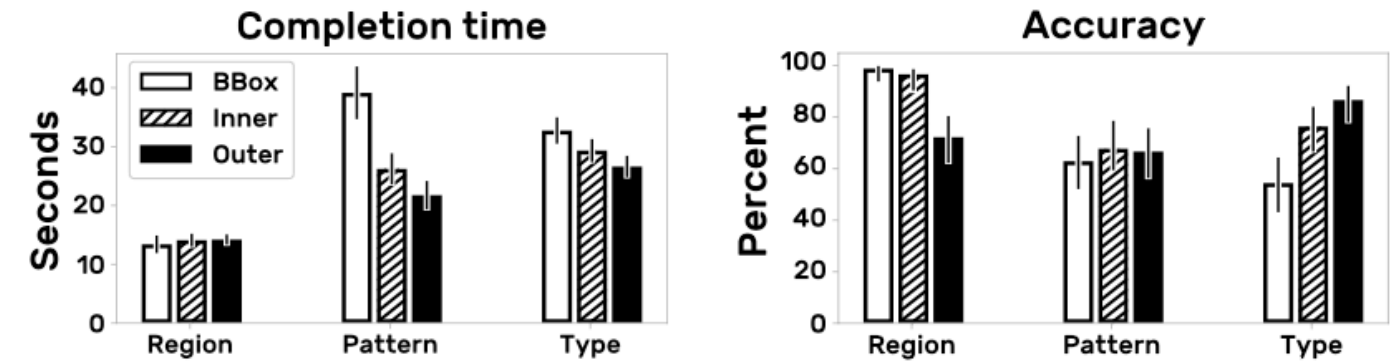

**C. Max. Details**

- algorithms
  - inset placement with simulated annealing
    - cost function as main contribution
  - aggregation
    - derived data: clustering (density-based dynamic) - as discussed in chapter
    - encoding: pile-based gallery

# Evaluation

- quant confirmatory study (N=18)
  - 3 methods: compare baseline (bbox) to proposed (SI inside, SI outside)
  - 3 tasks: region, pattern type
  - 5 trials per condition
  - measured time & errors
  - mixed results, some tradeoffs

- qual exploratory study with genomics domain experts (N=6)
  - how did people use it
- computational benchmarks
  - frame rate as # insets increases

# Multiple Views

# How to handle complexity: 1 previous strategy + 2 more

→ *Derive*

- derive new data to show within view
- change view over time
- facet across multiple views

## Manipulate

➔ Change

➔ Select

➔ Navigate

## Facet

➔ Juxtapose

➔ Partition

➔ Superimpose

# Facet

## ➔ Juxtapose

## ➔ Superimpose

# Juxtapose and coordinate views

→ Share Encoding: Same/Different

→ *Linked Highlighting*

→ Share Data: All/Subset/None

→ Share Navigation

# Linked views: Directionality

- unidirectional vs bidirectional linking
  - bidirectional almost always better!

<http://pbeshai.github.io/linked-highlighting-react-vega-redux/>

<https://medium.com/@pbesh/linked-highlighting-with-react-d3-js-and-reflux-16e9c0b2210b>

# Idiom: Overview-detail navigation

- encoding: same or different
- data: subset shared
- navigation: shared
  - unidirectional linking
  - select in small overview, change extent in large detail view

<https://observablehq.com/@uwdata/interaction>

# Idiom: **Tooltips**

- popup information for selection
  - hover or click
  - specific case of detail view:  
provide useful additional detail on demand
  - beware: does not support overview!
    - always consider if there's a way to visually encode directly to provide overview
    - “If you make a rollover or tooltip, assume nobody will see it. If it's important, make it explicit.”
      - Gregor Aisch, NYTimes

[\[https://www.highcharts.com/demo/dynamic-master-detail\]](https://www.highcharts.com/demo/dynamic-master-detail)

# Idiom: **Small multiples**

- encoding: same
  - ex: line charts
- data: none shared
  - different slices of dataset
    - items or attributes
    - ex: stock prices for different companies

# Interactive small multiples

- linked highlighting:  
analogous item/attribute  
across views
  - same year highlighted across all charts if hover within any chart

## The Rise and Decline of Ask MetaFilter

Metafilter's revenue has been on the decline, but has its content dried up as well?

Here we look at new posts on Ask Metafilter by category.

Categories like **computers & internet** have been dropping in use for a long time, most likely due to competition like Stack Overflow.

Other smaller categories have had consistent use patterns until more recently.

Disclaimer: 2014 is included, even though the year is not over yet.

[\[https://bl.ocks.org/ColinEberhardt/3c780088c363d1515403f50a87a87121\]](https://bl.ocks.org/ColinEberhardt/3c780088c363d1515403f50a87a87121)

[\[https://blog.scottlogic.com/2017/04/05/interactive-responsive-small-multiples.html\]](https://blog.scottlogic.com/2017/04/05/interactive-responsive-small-multiples.html)

[\[http://projects.flowingdata.com/tut/linked\\_small\\_multiples\\_demo/\]](http://projects.flowingdata.com/tut/linked_small_multiples_demo/)

# Example: Combining many interaction idioms

## System: **Buckets**

- multiform
- multidirectional linked highlighting of small multiples
- tooltips

<http://buckets.peterbeshai.com/>

# Juxtapose views: tradeoffs

- juxtapose costs
  - display area
    - 2 views side by side: each has only half the area of one view
- juxtapose benefits
  - cognitive load: eyes vs memory
    - lower cognitive load: move eyes between 2 views
    - higher cognitive load: compare single changing view to memory of previous state

# View coordination: Design choices

		Data		
		All	Subset	None
Encoding	Same	Redundant	 Overview/ Detail	 Small Multiples
	Different	 Multiform	 Multiform, Overview/ Detail	No Linkage

# Facet

## ➔ Juxtapose

## ➔ Partition

## ➔ Superimpose

# Partition into views

- how to divide data between views
  - split into regions by attributes
  - encodes association between items using spatial proximity
  - order of splits has major implications for what patterns are visible

## ➔ Partition into Side-by-Side Views

# Partitioning: Grouped vs small-multiple bars

- single bar chart with grouped bars
  - split by state into regions
    - complex glyph within each region showing all ages
  - compare: easy within state, hard across ages

[<https://observablehq.com/@d3/grouped-bar-chart>]

- small-multiple bar charts
  - split by age into regions
    - one chart per region
  - compare: easy within age, harder across states

[<https://bl.ocks.org/mbostock/4679202>]

# Partitioning: Grouped vs small multiples

- misleading graph
  - sorted non-chronologically

- Alberto Cairo redesign:
  - separate by county then sort chronologically

# Facet

## ➔ Juxtapose

## ➔ Partition

## ➔ Superimpose

# Superimpose layers

- layer: set of objects spread out over region
  - each set is visually distinguishable group
  - extent: whole view
- design choices
  - how many layers, how to distinguish?
    - encode with different, nonoverlapping channels
    - two layers achievable, three with careful design
  - small static set, or dynamic from many possible?

## ➔ Superimpose Layers

# Static visual layering

- foreground layer: roads
  - hue, size distinguishing main from minor
  - high luminance contrast from background
- background layer: regions
  - desaturated colors for water, parks, land areas
- user can selectively focus attention

[Get it right in black and white. Stone. 2010.  
<http://www.stonesc.com/wordpress/2010/03/get-it-right-in-black-and-white>]

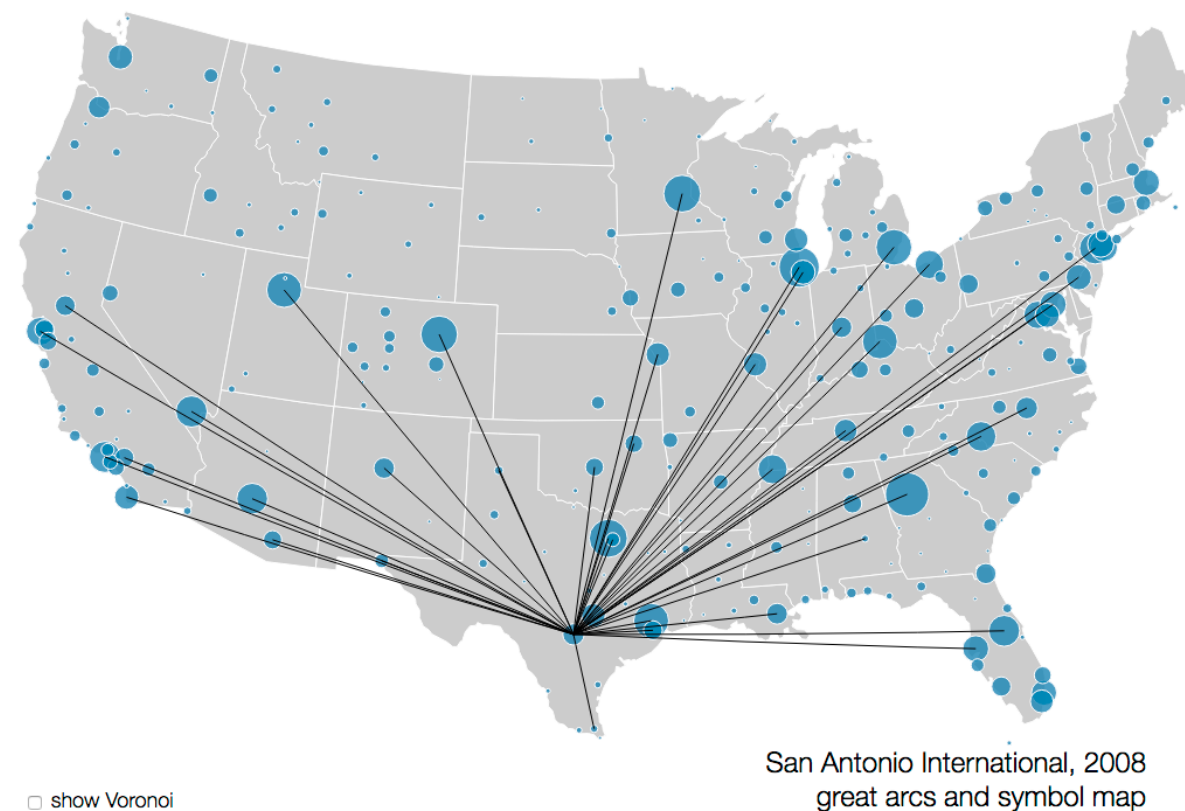

# Dynamic visual layering

- interactive, based on selection
- one-hop neighbour highlighting

click (heavyweight)

hover (fast)

### → Aggregate

### → Embed

What?

Why?

How?

# How to handle complexity: 3 previous strategies

→ *Derive*

- derive new data to show within view
- change view over time
- facet across multiple views

Manipulate

Facet

# How to handle complexity: 3 previous strategies + 1 more

→ *Derive*

- derive new data to show within view
- change view over time
- facet across multiple views
- reduce items/attributes within single view

Manipulate

Facet

Reduce

# Reduce items and attributes

- reduce/increase: inverses
- filter
  - pro: straightforward and intuitive
    - to understand and compute
  - con: out of sight, out of mind

## Reducing Items and Attributes

### ➔ Filter

➔ Items

➔ Attributes

# Reduce items and attributes

- reduce/increase: inverses
- filter
  - pro: straightforward and intuitive
    - to understand and compute
  - con: out of sight, out of mind
- aggregation
  - pro: inform about whole set
  - con: difficult to avoid losing signal
- not mutually exclusive
  - combine filter, aggregate
  - combine reduce, change, facet

## Reducing Items and Attributes

### ➔ Filter

➔ Items

➔ Attributes

### ➔ Aggregate

➔ Items

➔ Attributes

# Filter

- eliminate some elements
  - either items or attributes
- according to what?
  - any possible function that partitions dataset into two sets
    - attribute values bigger/smaller than x
    - noise/signal
- filters vs queries
  - query: start with nothing, add in elements
  - filters: start with everything, remove elements
  - best approach depends on dataset size

## Reducing Items and Attributes

### ➔ Filter

→ Items

→ Attributes

# Idiom: **cross filtering**

# System: **Crossfilter**

- item filtering
- coordinated views/controls combined
  - all scented histogram bisliders update when any ranges change

<http://square.github.io/crossfilter/>

<https://observablehq.com/@uwdata/interaction>

# Aggregate

- a group of elements is represented by a smaller number of derived elements

## ➔ Aggregate

### ➔ Items

### ➔ Attributes

# Idiom: **histogram**

- static item aggregation
- task: find distribution
- data: table
- derived data
  - new table: keys are bins, values are counts
- bin size crucial
  - pattern can change dramatically depending on discretization
  - opportunity for interaction: control bin size on the fly

# Idiom: **scented widgets**

- augmented widgets show *information scent*
  - better cues for *information foraging*: show whether value in drilling down further vs looking elsewhere
- concise use of space: histogram on slider

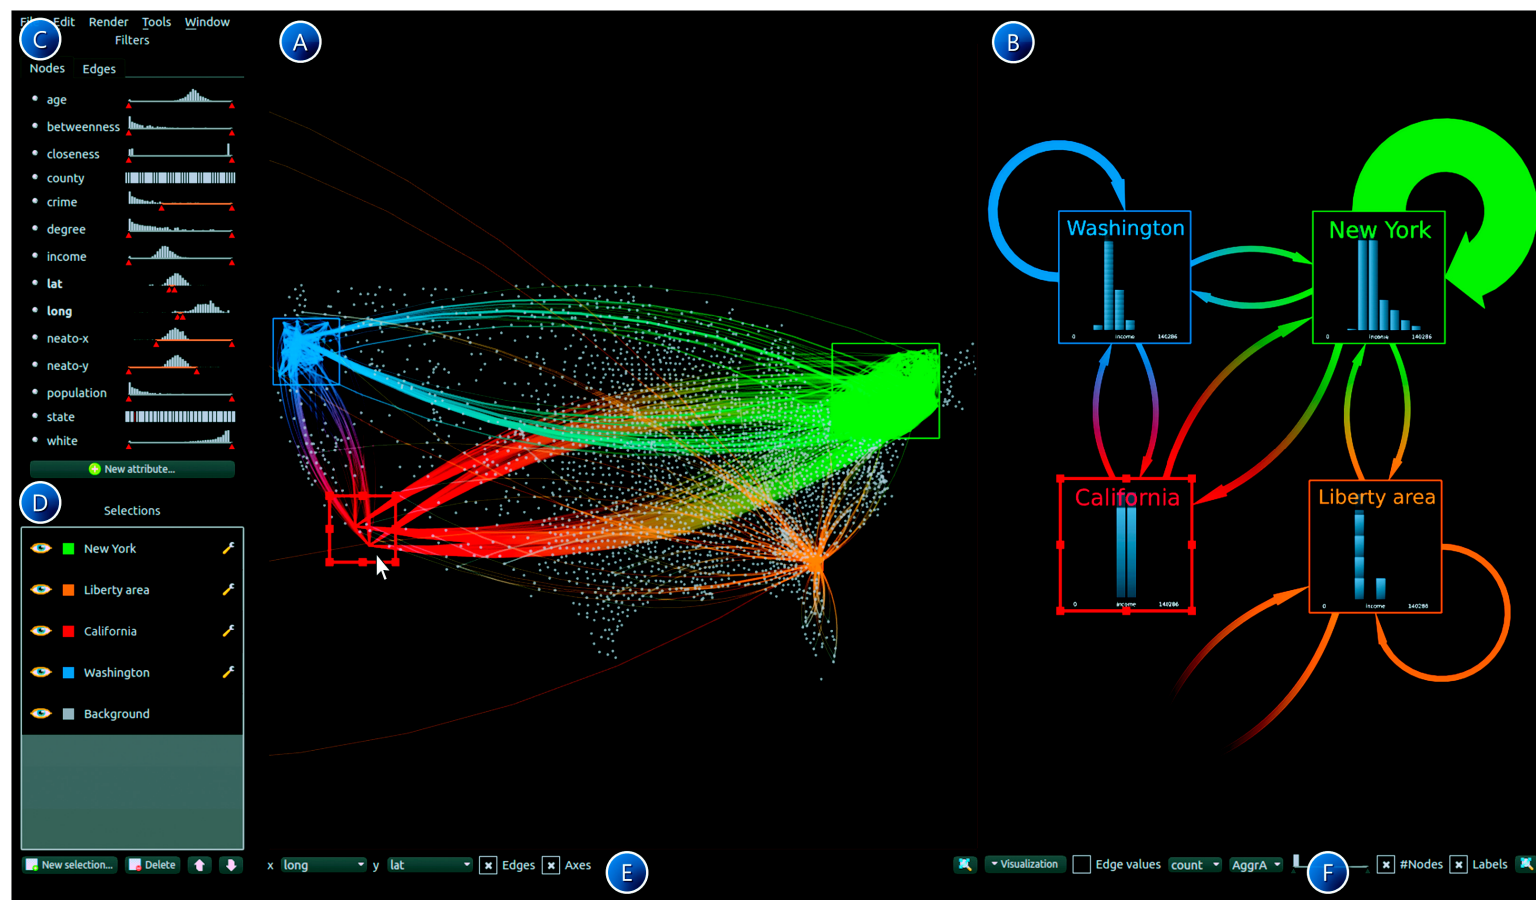

[Scented Widgets: Improving Navigation Cues with Embedded Visualizations. Willett, Heer, and Agrawala. IEEE TVCG (Proc. InfoVis 2007) 13:6 (2007), 1129–1136.]

# Idiom: scented widgets

- augmented widgets show *information scent*
  - better cues for *information foraging*: show whether value in drilling down further vs looking elsewhere
- concise use of space: histogram on slider

[Scented Widgets: Improving Navigation Cues with Embedded Visualizations. Willett, Heer, and Agrawala. IEEE TVCG (Proc. InfoVis 2007) 13:6 (2007), 1129–1136.]

[Multivariate Network Exploration and Presentation: From Detail to Overview via Selections and Aggregations. van den Elzen, van Wijk, IEEE TVCG 20(12): 2014 (Proc. InfoVis 2014).]

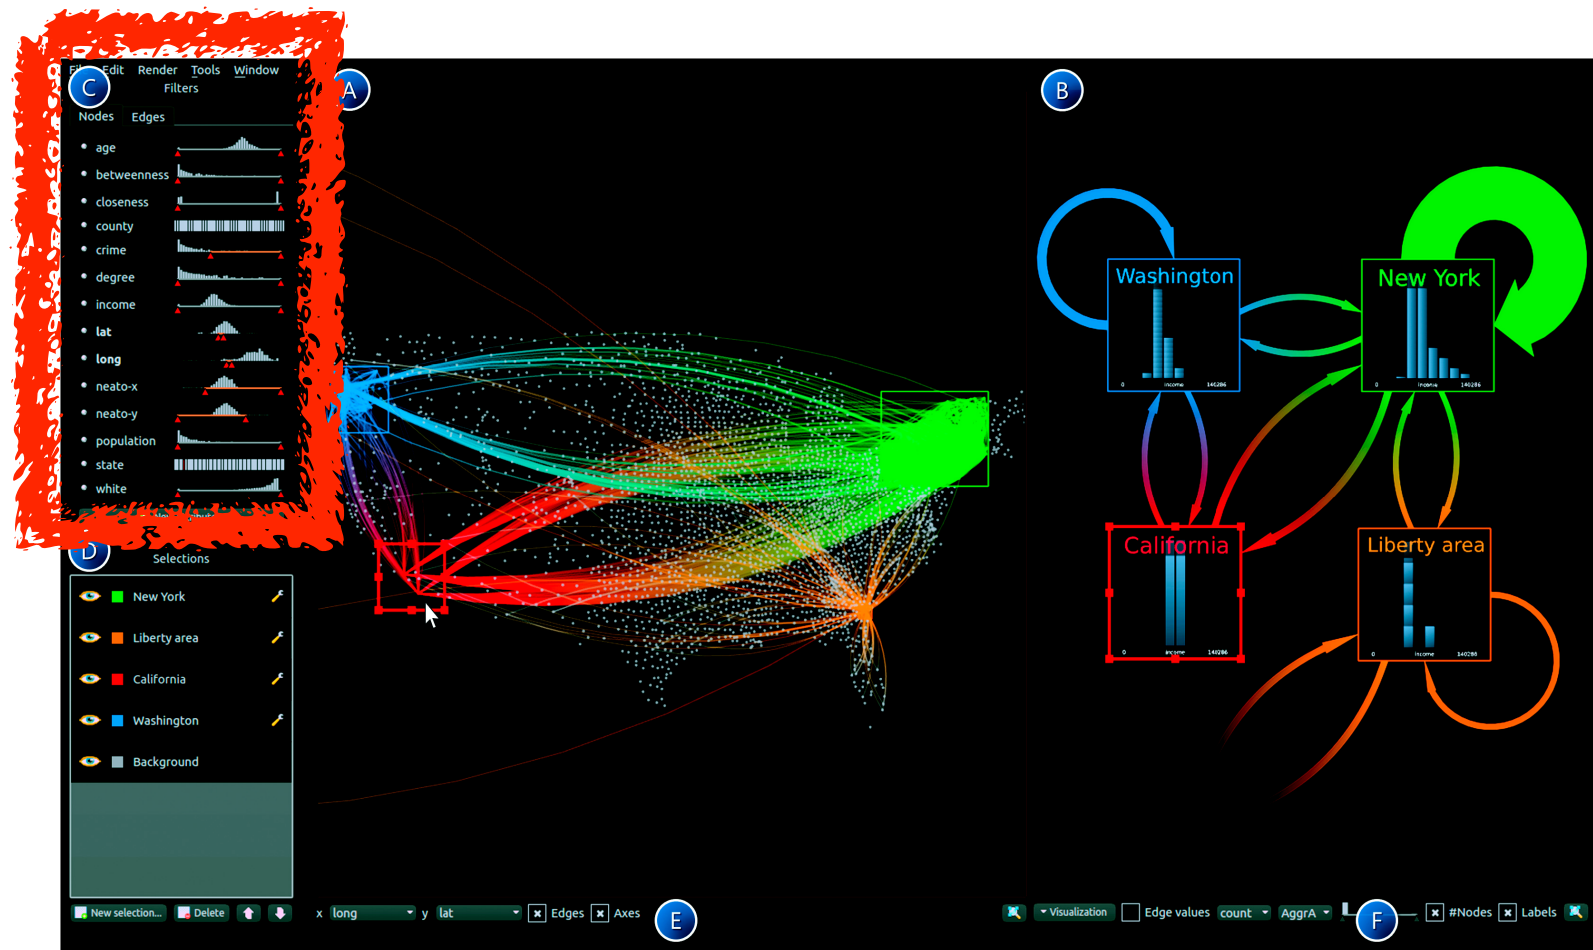

# Idiom: scented widgets

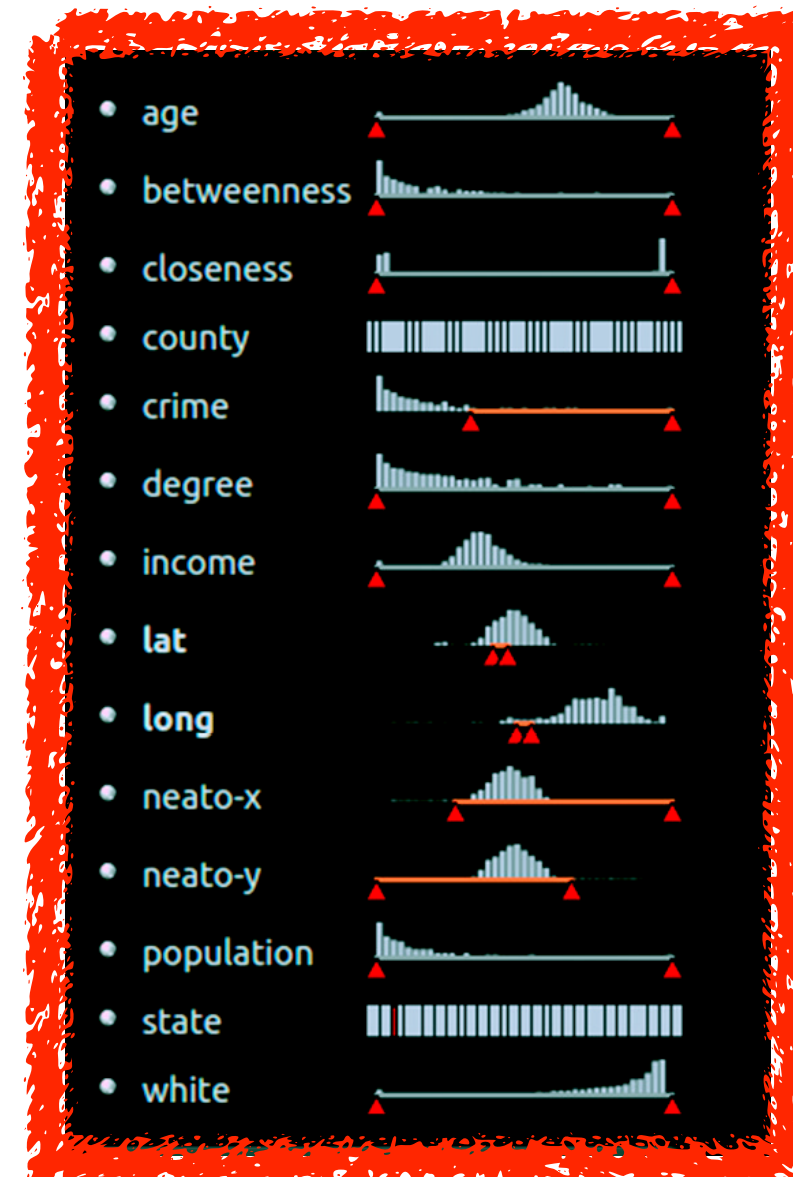

- augmented widgets show *information scent*
  - better cues for *information foraging*: show whether value in drilling down further vs looking elsewhere
- concise use of space: histogram on slider

[Scented Widgets: Improving Navigation Cues with Embedded Visualizations. Willett, Heer, and Agrawala. IEEE TVCG (Proc. InfoVis 2007) 13:6 (2007), 1129–1136.]

[Multivariate Network Exploration and Presentation: From Detail to Overview via Selections and Aggregations. van den Elzen, van Wijk, IEEE TVCG 20(12): 2014 (Proc. InfoVis 2014).]

# Scented histogram bisliders: detailed

[ICLIC: Interactive categorization of large image collections. van der Corput and van Wijk. Proc. PacificVis 2016.]

# Idiom: **boxplot**

- static item aggregation
- task: find distribution
- data: table
- derived data
  - 5 quant attribs
    - median: central line
    - lower and upper quartile: boxes
    - lower upper fences: whiskers
      - values beyond which items are outliers
  - outliers beyond fence cutoffs explicitly shown
- scalability
  - unlimited number of items!

# Idiom: Continuous scatterplot

- static item aggregation
- data: table
- derived data: table
  - key attrs x,y for pixels
  - quant attrib: overplot density
- dense space-filling 2D matrix
- color:  
sequential categorical hue +  
ordered luminance colormap
- scalability
  - no limits on overplotting:  
millions of items

[Continuous Scatterplots. Bachthaler and Weiskopf.  
IEEE TVCG (Proc.Vis 08) 14:6 (2008), 1428–1435. 2008.]

# Spatial aggregation

- MAUP: Modifiable Areal Unit Problem

- changing boundaries of cartographic regions can yield dramatically different results
- zone effects

[[http://www.e-education.psu.edu/geog486/l4\\_p7.html](http://www.e-education.psu.edu/geog486/l4_p7.html), Fig 4.cg.6]

- scale effects

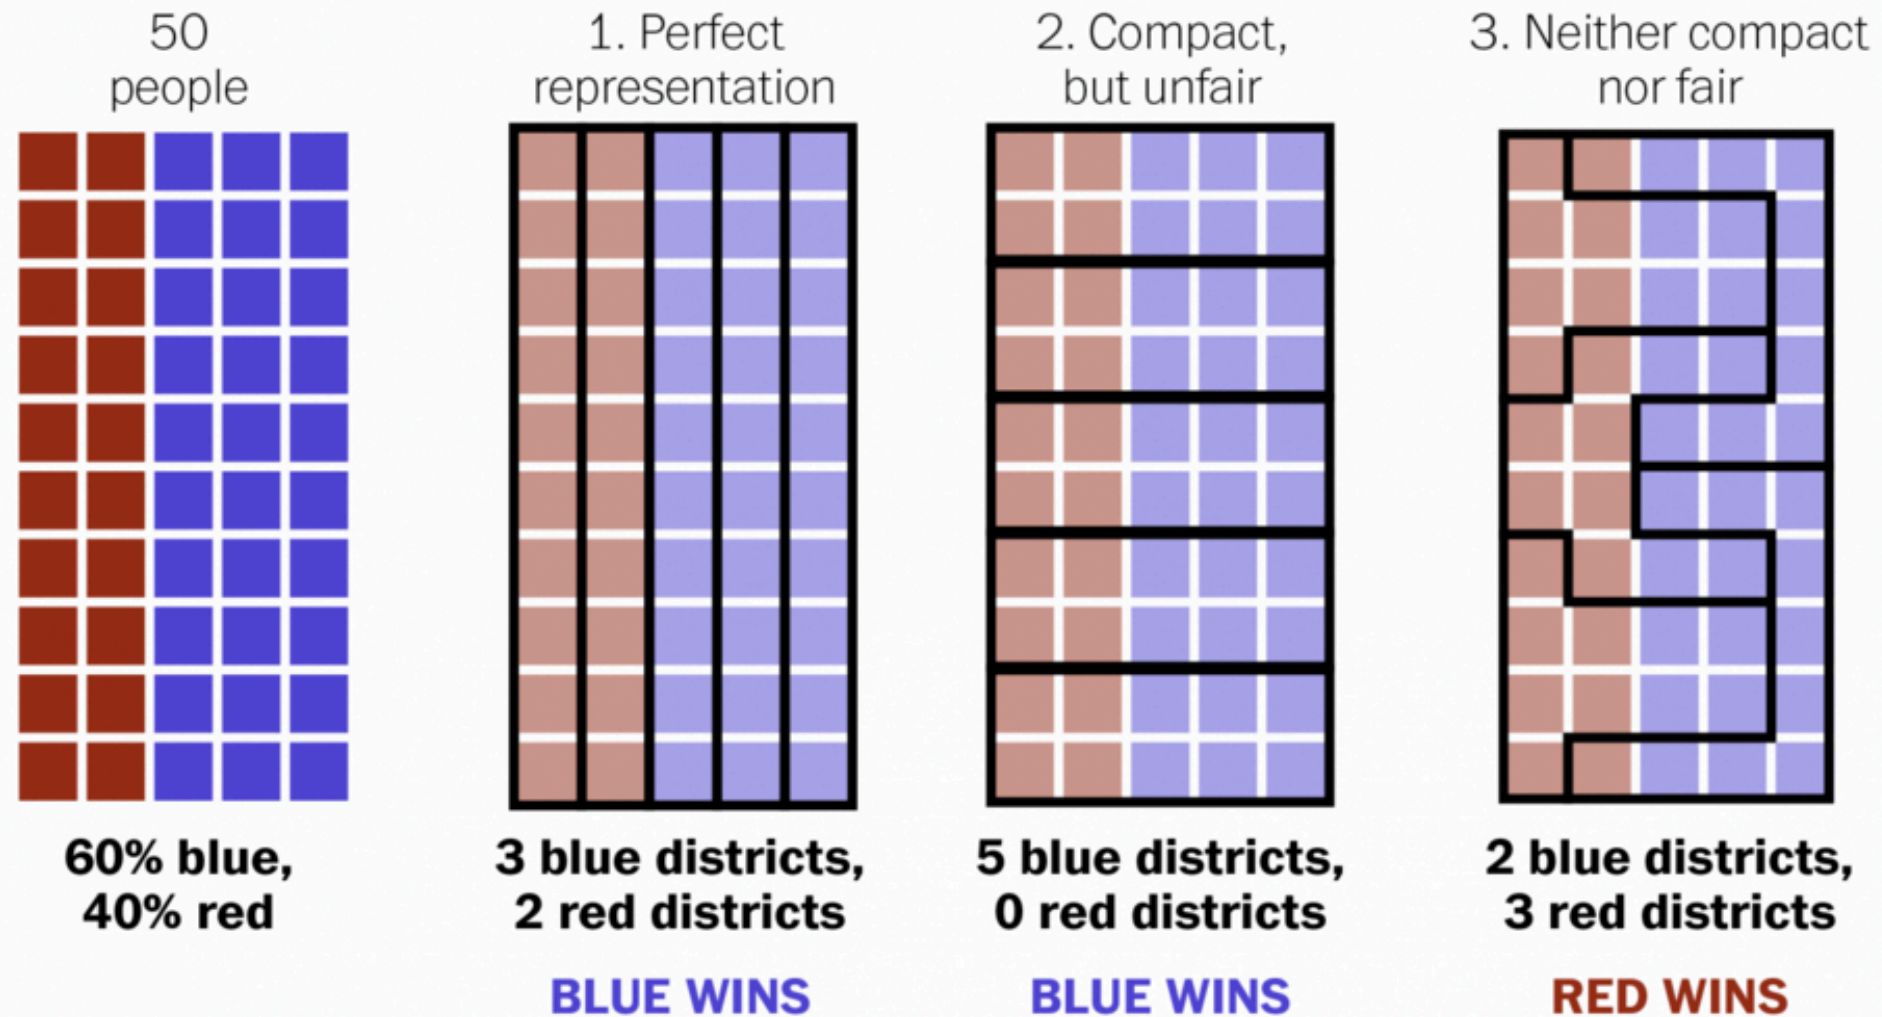

<https://blog.cartographica.com/blog/2011/5/19/the-modifiable-areal-unit-problem-in-gis.html>

# Gerrymandering: MAUP for political gain

## Gerrymandering, explained

Three different ways to divide 50 people into five districts

WASHINGTONPOST.COM/WONKBLOG

Adapted from Stephen Nass

A real district in Pennsylvania:  
Democrats won 51% of the vote but only 5 out of 18 house seats

<https://www.washingtonpost.com/news/wonk/wp/2015/03/01/this-is-the-best-explanation-of-gerrymandering-you-will-ever-see/>

# Dynamic aggregation: Clustering

- clustering: classification of items into similar bins
  - based on similarity measure
  - hierarchical algorithms produce "similarity tree": cluster hierarchy
    - agglomerative clustering: start w/ each node as own cluster, then iteratively merge
- cluster hierarchy: derived data used w/ many dynamic aggregation idioms
  - cluster more homogeneous than whole dataset
    - statistical measures & distribution more meaningful

# Idiom: Hierarchical parallel coordinates

- dynamic item aggregation
- derived data: **cluster hierarchy**
- encoding:
  - cluster band with variable transparency, line at mean, width by min/max values
  - color by proximity in hierarchy

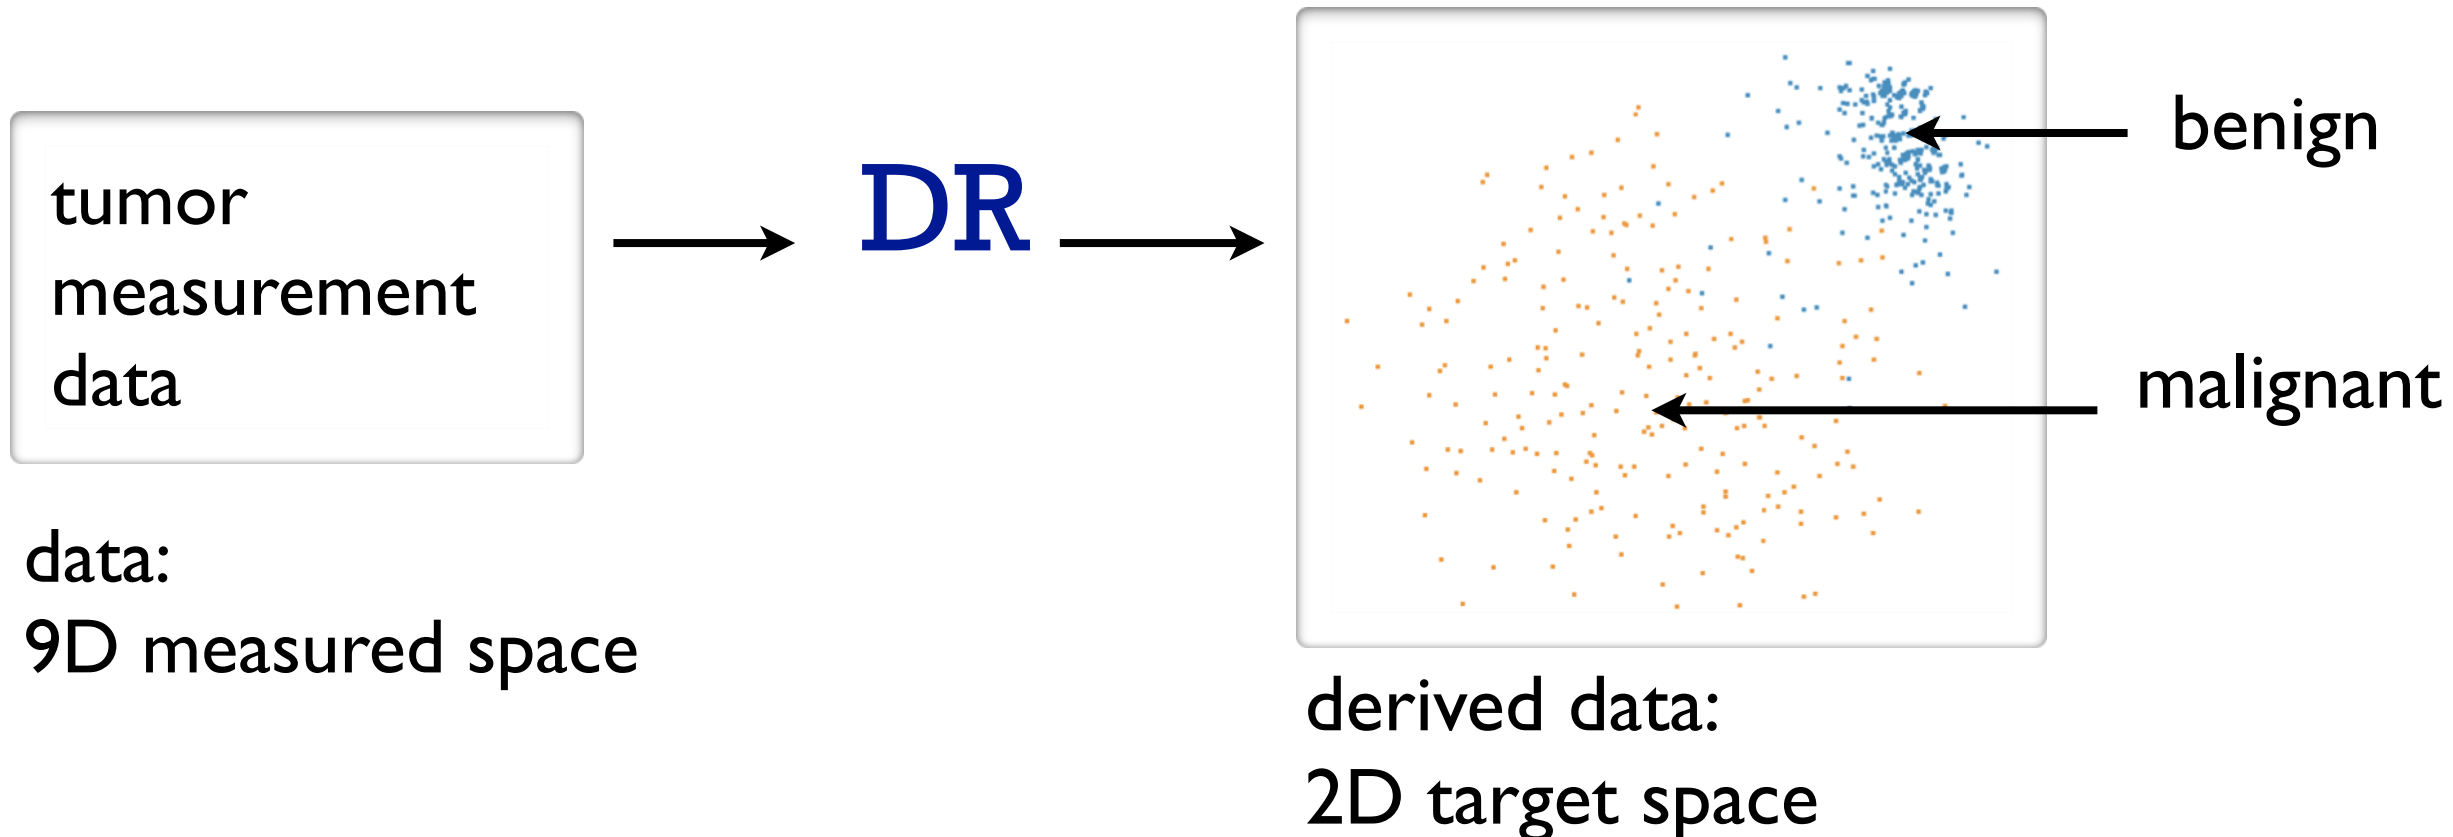

[Hierarchical Parallel Coordinates for Exploration of Large Datasets. Fua, Ward, and Rundensteiner.  
Proc. IEEE Visualization Conference (Vis '99), pp. 43– 50, 1999.]

# Dimensionality Reduction

# Attribute aggregation: Dimensionality reduction

- attribute aggregation
  - derive low-dimensional target space from high-dimensional measured space
    - capture most of variance with minimal error
  - use when you can't directly measure what you care about
    - true dimensionality of dataset conjectured to be smaller than dimensionality of measurements
    - latent factors, hidden variables

# Dimensionality vs attribute reduction

- vocab use in field not consistent
  - dimension/attribute
- attribute reduction: reduce set with filtering
  - includes orthographic projection
- dimensionality reduction: create smaller set of new dims/attribs
  - typically implies dimensional aggregation, not just filtering
  - vocab: projection/mapping

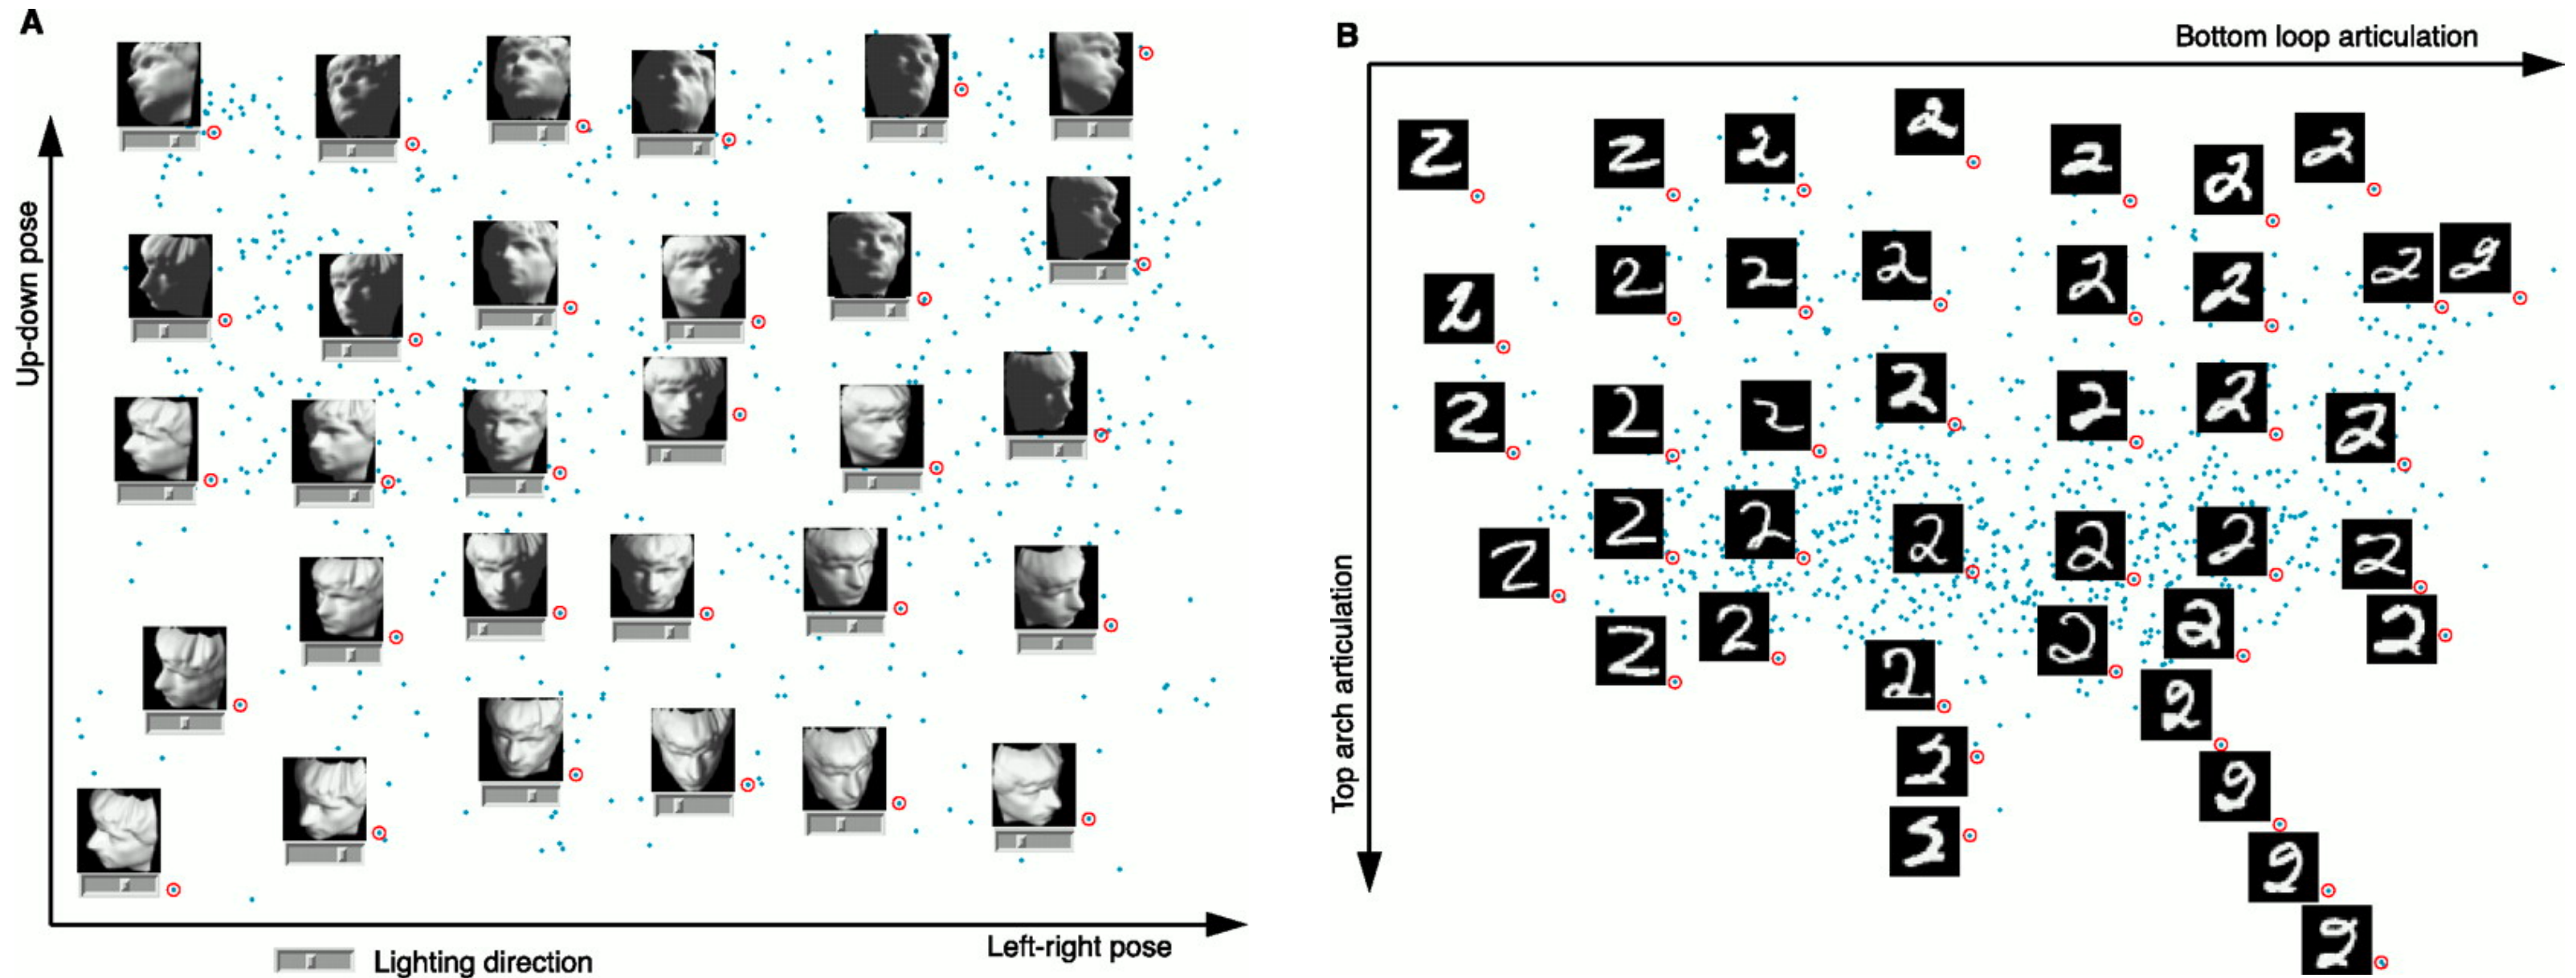

# Dimensionality reduction & visualization

- why do people do DR?
  - improve performance of downstream algorithm
    - avoid curse of dimensionality
  - data analysis
    - if look at the output: visual data analysis
- abstract tasks when visualizing DR data
  - dimension-oriented tasks
    - naming synthesized dims, mapping synthesized dims to original dims
  - cluster-oriented tasks
    - verifying clusters, naming clusters, matching clusters and classes

*[Visualizing Dimensionally-Reduced Data: Interviews with Analysts and a Characterization of Task Sequences. Brehmer, Sedlmair, Ingram, and Munzner. Proc. BELIV 2014.]*

# Dimension-oriented tasks

- naming synthesized dims: inspect data represented by lowD points

[A global geometric framework for nonlinear dimensionality reduction. Tenenbaum, de Silva, and Langford. Science, 290(5500):2319–2323, 2000.]

# Cluster-oriented tasks

- verifying, naming, matching to classes

no discernable clusters

clearly discernable clusters

clear match cluster/class

partial match cluster/class

no match cluster/class

*[Visualizing Dimensionally-Reduced Data: Interviews with Analysts and a Characterization of Task Sequences. Brehmer, Sedlmair, Ingram, and Munzner. Proc. BELIV 2014.]*

# Idiom: Dimensionality reduction for documents

## Task 1

**In** HD data → **Out** 2D data

- | <u>What?</u>                      | <u>Why?</u> |
|-----------------------------------|-------------|
| → <b>In</b> High-dimensional data | → Produce   |
| → <b>Out</b> 2D data              | → Derive    |

## Task 2

**In** 2D data → **Out** Scatterplot  
Clusters & points

- | <u>What?</u>                   | <u>Why?</u> | <u>How?</u> |
|--------------------------------|-------------|-------------|
| → <b>In</b> 2D data            | → Discover  | → Encode    |
| → <b>Out</b> Scatterplot       | → Explore   | → Navigate  |
| → <b>Out</b> Clusters & points | → Identify  | → Select    |

## Task 3

**In** Scatterplot  
Clusters & points → **Out** Labels for clusters

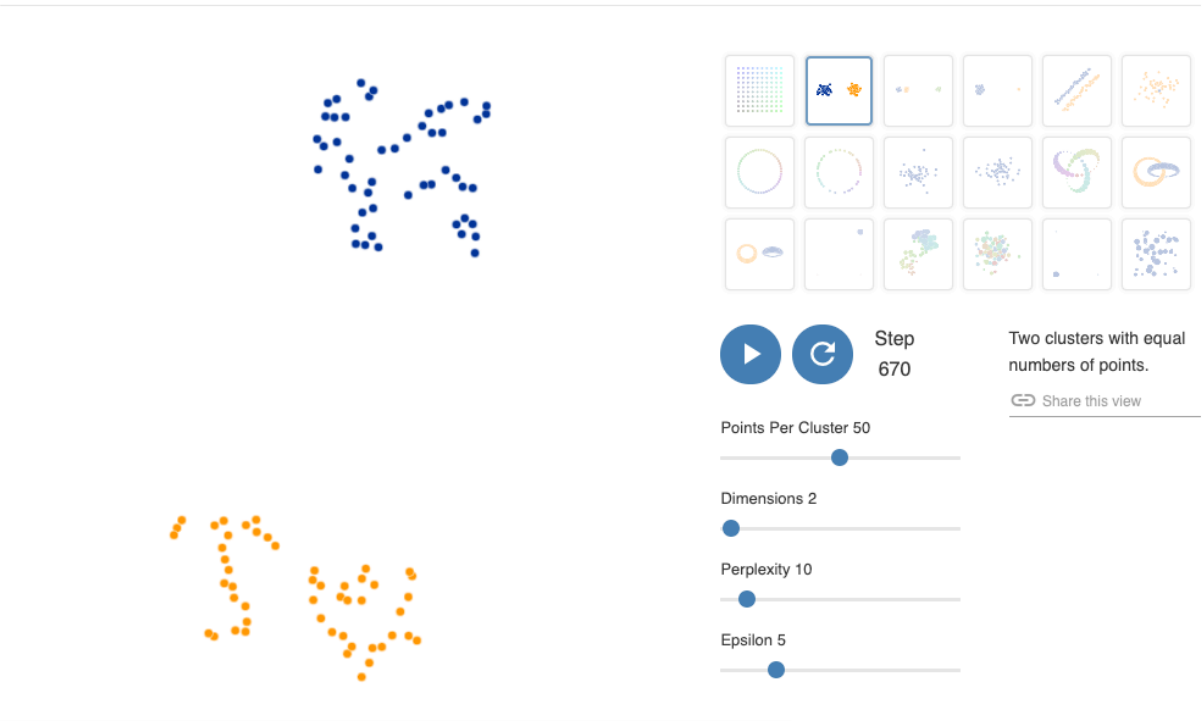

- | <u>What?</u>                     | <u>Why?</u> |
|----------------------------------|-------------|
| → <b>In</b> Scatterplot          | → Produce   |
| → <b>In</b> Clusters & points    | → Annotate  |
| → <b>Out</b> Labels for clusters |             |

# Latest algorithms: t-SNE, UMAP

- t-SNE      <https://distill.pub/2016/misread-tsne/>
- UMAP      <https://pair-code.github.io/understanding-umap/>

## How to Use t-SNE Effectively

Although extremely useful for visualizing high-dimensional data, t-SNE plots can sometimes be mysterious or misleading. By exploring how it behaves in simple cases, we can learn to use it more effectively.

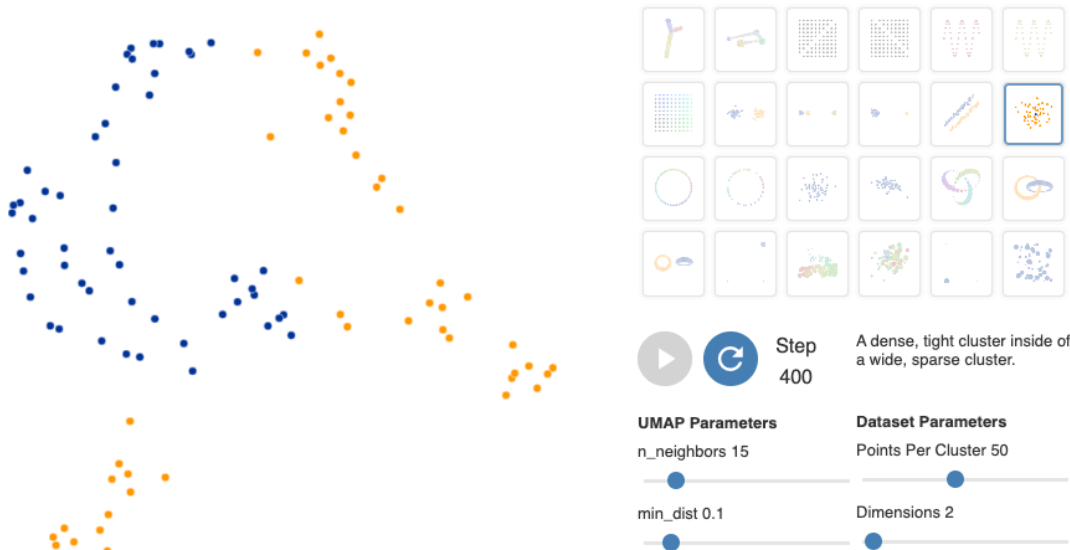

MARTIN WATTENBERG   FERNANDA VIÉGAS   IAN JOHNSON   Oct. 13   Citation:  
Google Brain   Google Brain   Google Cloud   2016   Wattenberg, et al., 2016

## Understanding UMAP

Andy Coenen, Adam Pearce | [Google PAIR](#)

Dimensionality reduction is a powerful tool for machine learning practitioners to visualize and understand large, high dimensional datasets. One of the most widely used techniques for visualization is [t-SNE](#), but its performance suffers with large datasets and using it correctly can be [challenging](#).

[UMAP](#) is a new technique by McInnes et al. that offers a number of advantages over t-SNE, most notably increased speed and better preservation of the data's global structure. In this article, we'll take a look at the theory behind UMAP in order to better understand how the algorithm works, how to use it effectively, and how its performance compares with t-SNE.

# Interacting with dimensionally reduced data

<https://uclab.fh-potsdam.de/projects/probing-projections/>

[Probing Projections: Interaction Techniques for Interpreting Arrangements and Errors of Dimensionality Reductions. Stahnke, Dörk, Müller, and Thom. IEEE TVCG (Proc. InfoVis 2015) 22(1):629-38 2016.]

# Linear dimensionality reduction

- principal components analysis (PCA)
  - finding axes: first with most variance, second with next most, ...
  - describe location of each point as linear combination of weights for each axis
    - mapping synthesized dims to original dims

*[<http://en.wikipedia.org/wiki/File:GaussianScatterPCA.png>]*

# Nonlinear dimensionality reduction

- pro: can handle curved rather than linear structure
- cons: lose all ties to original dims/attribs
  - new dimensions often cannot be easily related to originals
  - mapping synthesized dims to original dims task is difficult
- many techniques proposed
  - many literatures: visualization, machine learning, optimization, psychology, ...
  - techniques: t-SNE, MDS (multidimensional scaling), charting, isomap, LLE, ...
    - t-SNE: excellent for clusters
      - but some trickiness remains: <http://distill.pub/2016/misread-tsne/>
    - MDS: confusingly, entire family of techniques, both linear and nonlinear
      - minimize stress or strain metrics
      - early formulations equivalent to PCA

# VDA with DR example: nonlinear vs linear

- DR for computer graphics reflectance model
  - goal: simulate how light bounces off materials to make realistic pictures
    - computer graphics: BRDF (reflectance)
  - idea: measure what light does with real materials

[Fig 2. Matusik, Pfister, Brand, and McMillan. A Data-Driven Reflectance Model. SIGGRAPH 2003]

# Capturing & using material reflectance

- reflectance measurement: interaction of light with real materials (spheres)
- result: 104 high-res images of material
  - each image 4M pixels
- goal: image synthesis
  - simulate completely new materials
- need for more concise model
  - 104 materials \* 4M pixels = 400M dims
  - want concise model with meaningful knobs
    - how shiny/greasy/metallic
    - DR to the rescue!

[Figs 5/6. Matusik et al. A Data-Driven Reflectance Model. SIGGRAPH 2003]

# Linear DR

- first try: PCA (linear)
- result: error falls off sharply after ~45 dimensions
  - scree plots: error vs number of dimensions in lowD projection
- problem: physically impossible intermediate points when simulating new materials
  - specular highlights cannot have holes!

*[Figs 6/7. Matusik et al. A Data-Driven Reflectance Model. SIGGRAPH 2003]*

# Nonlinear DR

- second try: charting (nonlinear DR technique)
  - scree plot suggests 10-15 dims
  - note: dim estimate depends on technique used!

[Fig 10/11. Matusik et al. A Data-Driven Reflectance Model. SIGGRAPH 2003]

# Finding semantics for synthetic dimensions

- look for meaning in scatterplots
  - synthetic dims created by algorithm but named by human analysts
  - points represent real-world images (spheres)
  - people inspect images corresponding to points to decide if axis could have meaningful name
- cross-check meaning
  - arrows show simulated images (teapots) made from model
  - check if those match dimension semantics

row 4

# Understanding synthetic dimensions

## Specular-Metallic

# Spatialization Design

## *Comparing Points and Landscapes*

**joint work with:**

Melanie Tory, David W. Sprague, Fuqu Wu, Wing Yan So

<http://webhome.cs.uvic.ca/~mtory/publications/infovis2007.pdf>

Spatialization Design: Comparing Points and Landscapes.

Tory, Sprague, Wu, So, and Munzner.

IEEE TVCG 13(6):1262–1269, 2007 (Proc. InfoVis 07).

# Information Landscapes

- 2D or 3D landscape from set of DR points
  - height based on density
- oddly popular choice in DR
  - despite known occlusion/distortion problems with 3D
  - assertions: pattern recognition, spatial reasoning, familiar

Themescape:  
[<http://www.k-n-o-r-z.de/publ/example/retrieval1.htm>]

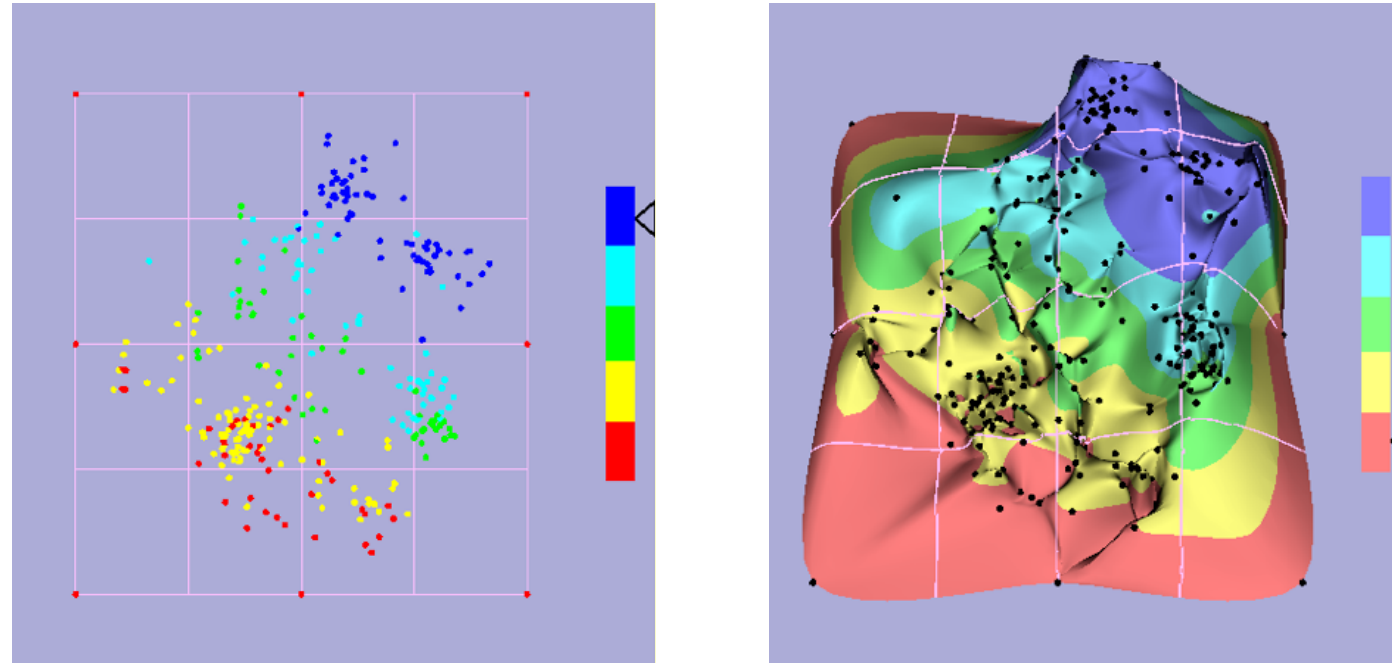

[Guide to MicroPatent Aureka 9 ThemeScape]

# Understanding User Task

- abstract: search involving spatial areas and estimation  
Estimate which grid cell has the most points of the target color

- domain-specific examples
  - “Where in the display are people with high incomes?”
  - “Does this area also have high education levels?”
  - “Does this area correspond to a particular work sector?”
- non-trivial complexity yet fast response time
- frequent subtask in pilot test of real data analysis

# Lab Study: Test Human Response Time and Error

- hypotheses
  - points are better than landscapes
    - result: yes!
    - much better: 2-4 × faster, 5-14 × more accurate
  - 2D landscapes (color only) better than 3D landscapes (color + height redundantly encoded)
    - result: yes
    - significantly faster, no significant difference in accuracy
