

# Visualization Analysis & Design

## Full-Day Tutorial

**Tamara Munzner**  
 Department of Computer Science  
 University of British Columbia  
 ACT  
 August 2016, Iowa City IA

<http://www.cs.ubc.ca/~tmm/talks.html#vad16act>

@tamaramunzner

### Outline

- Session 1 8:30-10:00am**  
**Visualization Analysis Framework**
  - Introduction: Definitions
  - Analysis: What, Why, How
  - Marks and Channels
- Session 2 10:30am-12:00pm**  
**Spatial Layout**
  - Arrange Tables
  - Arrange Spatial Data
  - Arrange Networks and Trees
- Session 3 1:00-2:30pm**  
**Color & Interaction**
  - Map Color
  - Manipulate: Change, Select, Navigate
  - Facet: Juxtapose, Partition, Superimpose
- Session 4 3:00-4:30pm**  
**Guidelines and Examples**
  - Reduce: Filter, Aggregate
  - Rules of Thumb
  - Q&A

<http://www.cs.ubc.ca/~tmm/talks.html#vad16act>

@tamaramunzner

### Defining visualization (vis)

Computer-based visualization systems provide visual representations of datasets designed to help people carry out tasks more effectively.

Why?...

### Why have a human in the loop?

Computer-based visualization systems provide visual representations of datasets designed to help people carry out tasks more effectively.

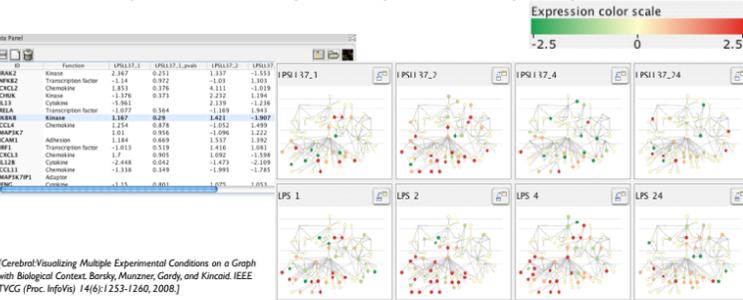

Visualization is suitable when there is a need to augment human capabilities rather than replace people with computational decision-making methods.

- don't need vis when fully automatic solution exists and is trusted
- many analysis problems ill-specified
  - don't know exactly what questions to ask in advance
- possibilities
  - long-term use for end users (e.g. exploratory analysis of scientific data)
  - presentation of known results
  - stepping stone to better understanding of requirements before developing models
  - help developers of automatic solution refine/debug, determine parameters
  - help end users of automatic solutions verify, build trust

### Why use an external representation?

Computer-based visualization systems provide visual representations of datasets designed to help people carry out tasks more effectively.

- external representation: replace cognition with perception

[Cerebra] Visualizing Multiple Experimental Conditions on a Graph with Biological Context. Bersky, Munzner, Gandy, and Kincaid. IEEE TVCG (Proc. InfoVis) 14(6):1253-1260, 2008.

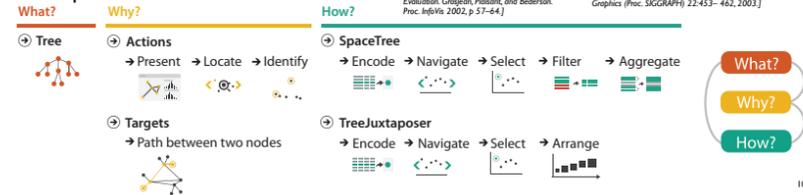

### Why depend on vision?

Computer-based visualization systems provide visual representations of datasets designed to help people carry out tasks more effectively.

- human visual system is high-bandwidth channel to brain
  - overview possible due to background processing
    - subjective experience of seeing everything simultaneously
    - significant processing occurs in parallel and pre-attentively
- sound: lower bandwidth and different semantics
  - overview not supported
    - subjective experience of sequential stream
- touch/haptics: impoverished record/replay capacity
  - only very low-bandwidth communication thus far
- taste, smell: no viable record/replay devices

### Why analyze?

- imposes structure on huge design space
  - scaffold to help you think systematically about choices
  - analyzing existing as stepping stone to designing new
  - most possibilities ineffective for particular task/data combination

### Why is validation difficult?

- different ways to get it wrong at each level

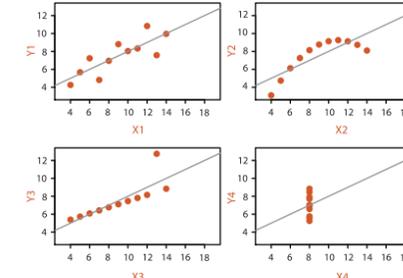

### Why represent all the data?

Computer-based visualization systems provide visual representations of datasets designed to help people carry out tasks more effectively.

- summaries lose information, details matter
  - confirm expected and find unexpected patterns
  - assess validity of statistical model

#### Anscombe's Quartet

Identical statistics	
x mean	9
x variance	10
y mean	7.5
y variance	3.75
x/y correlation	0.816

### Further reading

- Visualization Analysis and Design. Munzner. AK Peters Visualization Series, CRC Press, 2014.
  - Chap 1: What's Vis, and Why Do It?

### Why focus on tasks and effectiveness?

Computer-based visualization systems provide visual representations of datasets designed to help people carry out tasks more effectively.

- tasks serve as constraint on design (as does data)
  - idioms do not serve all tasks equally!
  - challenge: recast tasks from domain-specific vocabulary to abstract forms
- most possibilities ineffective
  - validation is necessary, but tricky
  - increases chance of finding good solutions if you understand full space of possibilities
- what counts as effective?
  - novel: enable entirely new kinds of analysis
  - faster: speed up existing workflows

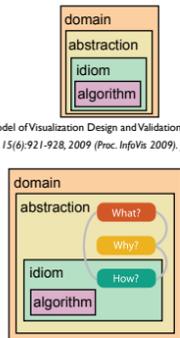

### What resource limitations are we faced with?

Vis designers must take into account three very different kinds of resource limitations: those of computers, of humans, and of displays.

- computational limits
  - processing time
  - system memory
- human limits
  - human attention and memory
- display limits
  - pixels are precious resource, the most constrained resource
  - information density: ratio of space used to encode info vs unused whitespace
    - tradeoff between clutter and wasting space, find sweet spot between dense and sparse

### Analysis framework: Four levels, three questions

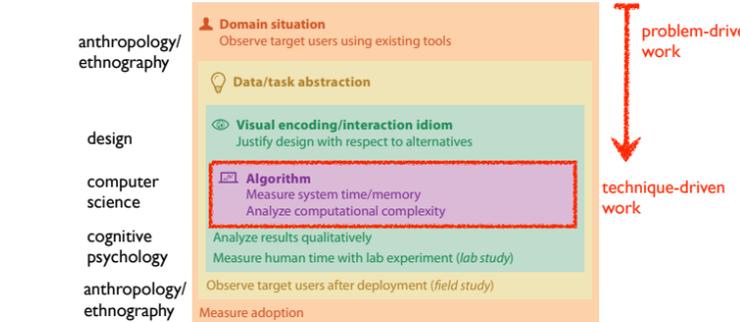

- domain situation
  - who are the target users?
- abstraction
  - translate from specifics of domain to vocabulary of vis
- what is shown? data abstraction
  - often don't just draw what you're given: transform to new form
- why is the user looking at it? task abstraction
- idiom
- how is it shown?
  - visual encoding idiom: how to draw
  - interaction idiom: how to manipulate
- algorithm
  - efficient computation

[A Multi-Level Typology of Abstract Visualization Tasks. Brehmer and Munzner. IEEE TVCG 19(12):2376-2385, 2013 (Proc. InfoVis 2013).]

### Why is validation difficult?

- solution: use methods from different fields at each level

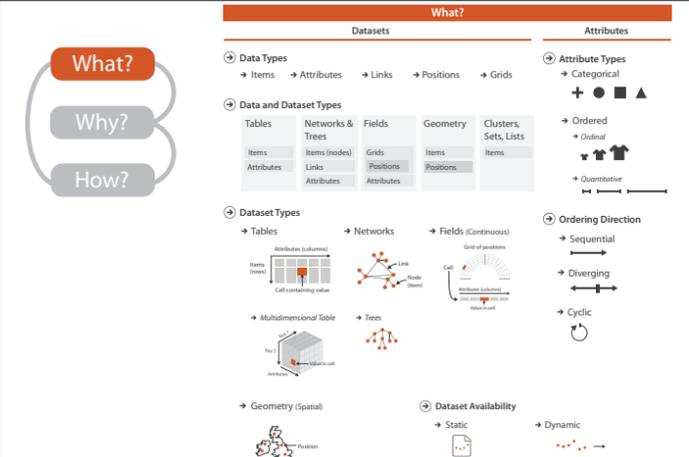

[A Nested Model of Visualization Design and Validation. Munzner. IEEE TVCG 15(6):921-928, 2009 (Proc. InfoVis 2009).]

### Outline

- Session 1 8:30-10:00am**  
**Visualization Analysis Framework**
  - Introduction: Definitions
  - Analysis: What, Why, How
  - Marks and Channels
- Session 2 10:30am-12:00pm**  
**Spatial Layout**
  - Arrange Tables
  - Arrange Spatial Data
  - Arrange Networks and Trees
- Session 3 1:00-2:30pm**  
**Color & Interaction**
  - Map Color
  - Manipulate: Change, Select, Navigate
  - Facet: Juxtapose, Partition, Superimpose
- Session 4 3:00-4:30pm**  
**Guidelines and Examples**
  - Reduce: Filter, Aggregate
  - Rules of Thumb
  - Q&A

<http://www.cs.ubc.ca/~tmm/talks.html#vad16act>

@tamaramunzner

# Three major datatypes

## Dataset Types

- Tables**
  - Attributes (columns)
  - Items (rows)
  - Cell containing value
  - Multidimensional Table
- Networks**
  - Link
  - Node (Item)
  - Trees
- Spatial**
  - Fields (Continuous)
  - Geometry (Spatial)
  - Grid of positions
  - Cell
  - Attributes (columns)
  - Value in cell
  - Position

• visualization vs computer graphics  
– geometry is design decision

# Dataset and data types

## Data and Dataset Types

Tables	Networks & Trees	Fields	Geometry	Clusters, Sets, Lists
Items	Items (nodes)	Grids	Items	Items
Attributes	Links	Positions	Positions	
	Attributes	Attributes		

## Data Types

- Items
- Attributes
- Links
- Positions
- Grids

## Dataset Availability

- Static
- Dynamic

# Attribute types

## Attribute Types

- Categorical: +, ●, ■, ▲
- Ordered: → Ordinal, → Quantitative

## Ordering Direction

- Sequential: →
- Diverging: ↔
- Cyclic: ↻

## Why?

What? Why? How?

### Actions

- Analyze: Consume (Discover, Present, Enjoy), Produce (Annotate, Record, Derive)
- Search: Location known (Lookup, Browse), Location unknown (Locate, Explore)
- Query: Identify, Compare, Summarize

### Targets

- All Data: Trends, Outliers, Features
- Attributes: One, Many, Distribution, Dependency, Correlation, Similarity
- Network Data: Topology, Paths
- Spatial Data: Shape

• {action, target} pairs

- discover distribution
- compare trends
- locate outliers
- browse topology

## Actions: Analyze

- consume
  - discover vs present
    - classic split
    - aka explore vs explain
  - enjoy
    - newcomer
    - aka casual, social
- produce
  - annotate, record
  - derive
    - crucial design choice

## Derive

- don't just draw what you're given!
- decide what the right thing to show is
- create it with a series of transformations from the original dataset
- draw that
- one of the four major strategies for handling complexity

Original Data: exports, imports

Derived Data: trade balance = exports - imports

## Actions: Search, query

- what does user know? Search
  - target, location
- how much of the data matters?
  - one, some, all
- independent choices for each of these three levels
  - analyze, search, query
  - mix and match

	Target known	Target unknown
Location known	Lookup	Browse
Location unknown	Locate	Explore

Query: Identify, Compare, Summarize

## Analysis example: Derive one attribute

- Strahler number
  - centrality metric for trees/networks
  - derived quantitative attribute
  - draw top 5K of 500K for good skeleton

[Using Strahler numbers for real time visual exploration of huge graphs. Auber. Proc. Intl. Conf. Computer Vision and Graphics, pp. 56-69, 2002.]

Task 1: In Tree → Out Quantitative attribute on nodes

Task 2: In Tree + In Quantitative attribute on nodes → Out Filtered Tree (Removed unimportant parts)

What? Why? How?

- What? In Tree, Out Quantitative attribute on nodes
- Why? Derive
- How? Summarize, Reduce, Topology, Filter

## Why: Targets

- All Data: Trends, Outliers, Features
- Attributes: One, Many, Distribution, Dependency, Correlation, Similarity, Extremes
- Network Data: Topology, Paths
- Spatial Data: Shape

## How?

Encode	Manipulate	Facet	Reduce
<ul style="list-style-type: none"> <li>Arrange: Express, Order, Use</li> <li>Map: Color (Hue, Saturation, Luminance), Size, Angle, Curvature, Shape, Motion</li> </ul>	<ul style="list-style-type: none"> <li>Change, Select, Navigate</li> </ul>	<ul style="list-style-type: none"> <li>Juxtapose, Partition, Superimpose</li> </ul>	<ul style="list-style-type: none"> <li>Filter, Aggregate, Embed</li> </ul>

What? Why? How?

## Outline

- Session 1 8:30-10:00am Visualization Analysis Framework
  - Introduction: Definitions
  - Analysis: What, Why, How
  - Marks and Channels
- Session 2 10:30am-12:00pm Spatial Layout
  - Arrange Tables
  - Arrange Spatial Data
  - Arrange Networks and Trees
- Session 3 1:00-2:30pm Color & Interaction
  - Map Color
  - Manipulate: Change, Select, Navigate
  - Facet: Juxtapose, Partition, Superimpose
- Session 4 3:00-4:30pm Guidelines and Examples
  - Reduce: Filter, Aggregate
  - Rules of Thumb
  - Q&A

<http://www.cs.ubc.ca/~tmm/talks.html#vad16act> @tamaramunzner

## Visual encoding

- analyze idiom structure

## Definitions: Marks and channels

- marks
  - geometric primitives
- channels
  - control appearance of marks
  - can redundantly code with multiple channels

Points, Lines, Areas

Position: Horizontal, Vertical, Both

Color

Shape: ▲, \*, /, L

Tilt

Size: Length, Area, Volume

## Visual encoding

- analyze idiom structure
- as combination of marks and channels

1: vertical position

2: vertical position, horizontal position

3: vertical position, horizontal position, color hue

4: vertical position, horizontal position, color hue, size (area)

mark: line, mark: point, mark: point, mark: point

## Channels

- Position on common scale
- Position on unaligned scale
- Length (1D size)
- Tilt/angle
- Area (2D size)
- Depth (3D position)
- Color luminance
- Color saturation
- Curvature
- Volume (3D size)

- Spatial region
- Color hue
- Motion
- Shape

# Channels: Matching Types

**Magnitude Channels: Ordered Attributes**

- Position on common scale
- Position on unaligned scale
- Length (1D size)
- Tilt/angle
- Area (2D size)
- Depth (3D position)
- Color luminance
- Color saturation
- Curvature
- Volume (3D size)

**Identity Channels: Categorical Attributes**

- Spatial region
- Color hue
- Motion
- Shape

• expressiveness principle  
– match channel and data characteristics

# Channels: Rankings

**Magnitude Channels: Ordered Attributes**

- Position on common scale
- Position on unaligned scale
- Length (1D size)
- Tilt/angle
- Area (2D size)
- Depth (3D position)
- Color luminance
- Color saturation
- Curvature
- Volume (3D size)

**Identity Channels: Categorical Attributes**

- Spatial region
- Color hue
- Motion
- Shape

• expressiveness principle  
– match channel and data characteristics

• effectiveness principle  
– encode most important attributes with highest ranked channels

# Channels: Expressiveness types and effectiveness rankings

**Magnitude Channels: Ordered Attributes**

- Position on common scale
- Position on unaligned scale
- Length (1D size)
- Tilt/angle
- Area (2D size)
- Depth (3D position)
- Color luminance
- Color saturation
- Curvature
- Volume (3D size)

**Identity Channels: Categorical Attributes**

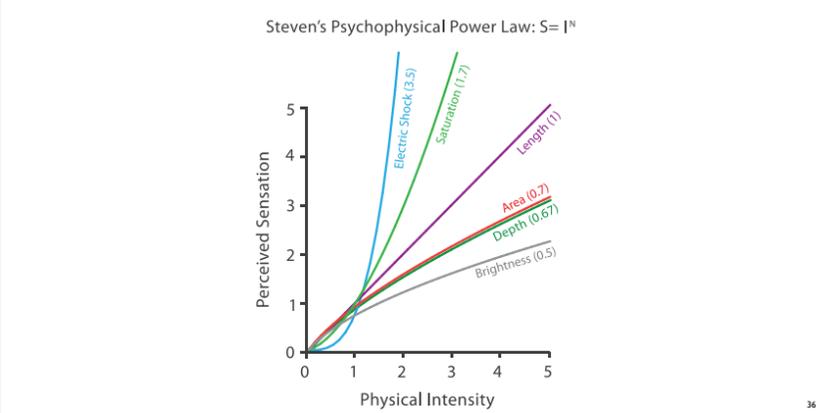

- Spatial region
- Color hue
- Motion
- Shape

• expressiveness principle  
– match channel and data characteristics

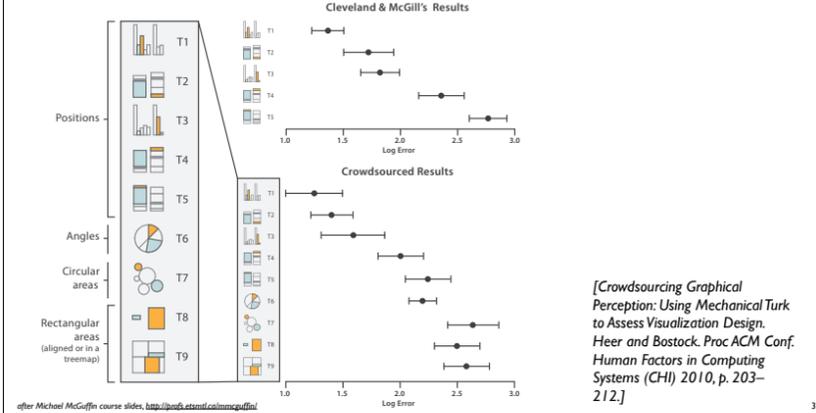

• effectiveness principle  
– encode most important attributes with highest ranked channels

– spatial position ranks high for both

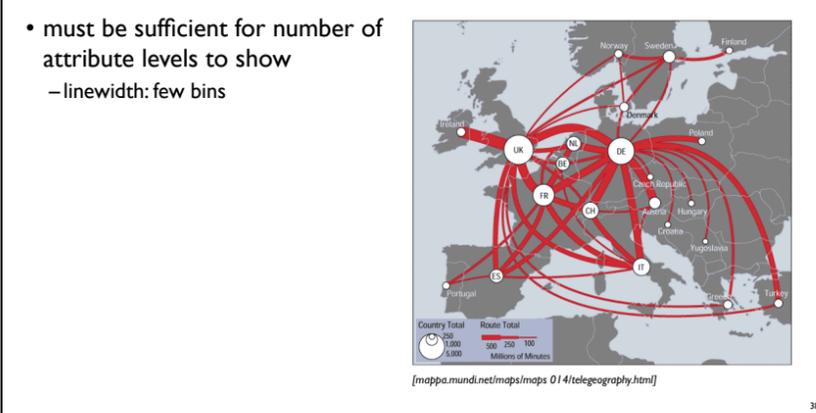

# Accuracy: Fundamental Theory

# Accuracy: Vis experiments

# Discriminability: How many usable steps?

# Separability vs. Integrality

Position + Hue (Color)

Size + Hue (Color)

Width + Height

Red + Green

Fully separable    Some interference    Some/significant interference    Major interference

2 groups each    2 groups each    3 groups total: integral area    4 groups total: integral hue

# Popout

• find the red dot  
– how long does it take?

• parallel processing on many individual channels  
– speed independent of distractor count  
– speed depends on channel and amount of difference from distractors

• serial search for (almost all) combinations  
– speed depends on number of distractors

# Popout

• many channels: tilt, size, shape, proximity, shadow direction, ...  
• but not all! parallel line pairs do not pop out from tilted pairs

# Grouping

**Marks as Links**

- Containment
- Connection

**Identity Channels: Categorical Attributes**

- Spatial region
- Color hue
- Motion
- Shape

• containment  
• connection

• proximity  
– same spatial region

• similarity  
– same values as other categorical channels

# Relative vs. absolute judgements

• perceptual system mostly operates with relative judgements, not absolute  
– that's why accuracy increases with common frame/scale and alignment

– Weber's Law: ratio of increment to background is constant

- filled rectangles differ in length by 1:9, difficult judgement
- white rectangles differ in length by 1:2, easy judgement

# Relative luminance judgements

• perception of luminance is contextual based on contrast with surroundings

# Relative color judgements

• color constancy across broad range of illumination conditions

## Encode tables: Arrange space

### Encode

#### Arrange

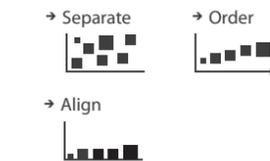

49

## Arrange tables

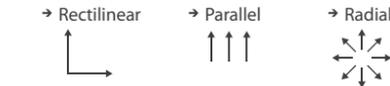

### Express Values

### Separate, Order, Align Regions

### Axis Orientation

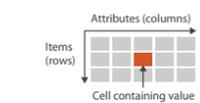

### Layout Density

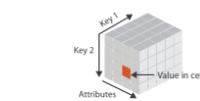

50

## Keys and values

### Tables

### Multidimensional Table

- **key**
  - independent attribute
  - used as unique index to look up items
  - simple tables: 1 key
  - multidimensional tables: multiple keys
- **value**
  - dependent attribute, value of cell
- **classify arrangements by key count**
  - 0, 1, 2, many...

## Idiom: scatterplot

### Express Values

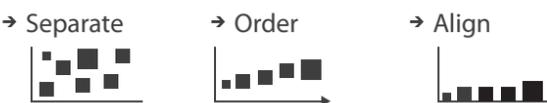

- **express values**
  - quantitative attributes
- **no keys, only values**
  - data
    - 2 quant attribs
  - mark: points
  - channels
    - horiz + vert position
  - tasks
    - find trends, outliers, distribution, correlation, clusters
  - scalability
    - hundreds of items

[A layered grammar of graphics. Wickham. Journ. Computational and Graphical Statistics 19:1 (2010), 3–28.]

52

## Some keys: Categorical regions

- **regions: contiguous bounded areas distinct from each other**
  - using space to *separate* (proximity)
  - following expressiveness principle for categorical attributes
- **use ordered attribute to order and align regions**

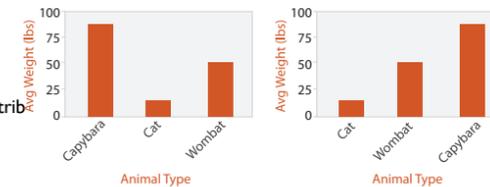

53

## Idiom: bar chart

### one key, one value

- data
  - 1 categ attrib, 1 quant attrib
- mark: lines
- channels
  - length to express quant value
  - spatial regions: one per mark
    - separated horizontally, aligned vertically
    - ordered by quant attrib
      - » by label (alphabetical), by length attrib (data-driven)
- task
  - compare, lookup values
- scalability
  - dozens to hundreds of levels for key attrib

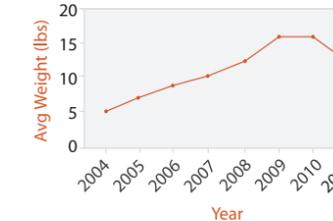

54

## Idiom: line chart

### one key, one value

- data
  - 2 quant attribs
- mark: points
- channels
  - line connection marks between them
- channels
  - aligned lengths to express quant value
  - separated and ordered by key attrib into horizontal regions
- task
  - find trend
    - connection marks emphasize ordering of items along key axis by explicitly showing relationship between one item and the next

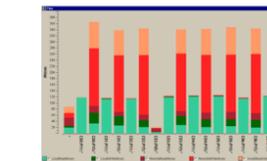

55

## Idiom: stacked bar chart

### one more key

- data
  - 2 categ attrib, 1 quant attrib
- mark: vertical stack of line marks
  - **glyph**: composite object, internal structure from multiple marks
- channels
  - length and color hue
  - spatial regions: one per glyph
    - aligned: full glyph, lowest bar component
    - unaligned: other bar components
- task
  - part-to-whole relationship
- scalability
  - several to one dozen levels for stacked attrib

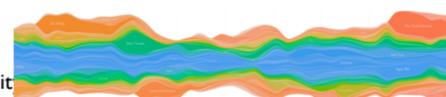

[Using Visualization to Understand the Behavior of Computer Systems. Bosch, Ph.D. thesis, Stanford Computer Science, 2001.]

56

## Idiom: streamgraph

### generalized stacked graph

- emphasizing horizontal continuity
  - vs vertical items
- data
  - 1 categ key attrib (artist)
  - 1 ordered key attrib (time)
  - 1 quant value attrib (counts)
- derived data
  - geometry: layers, where height encodes counts
  - 1 quant attrib (layer ordering)
- scalability
  - hundreds of time keys
  - dozens to hundreds of artist keys
    - more than stacked bars, since most layers don't extend across whole chart

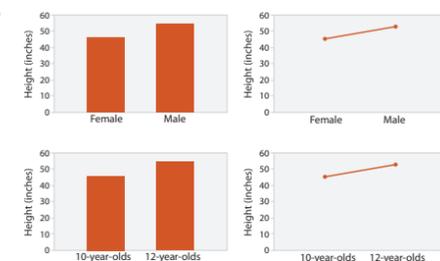

[Stacked Graphs Geometry & Aesthetics. Byron and Wattenberg. IEEE Trans. Visualization and Computer Graphics (Proc. InfoVis 2008) 14(6): 1245–1252, (2008).]

57

## Choosing bar vs line charts

### depends on type of key attrib

- bar charts if categorical
- line charts if ordered
- **do not use line charts for categorical key attribs**
  - violates expressiveness principle
    - implication of trend so strong that it overrides semantics!
      - “The more male a person is, the taller he/she is”

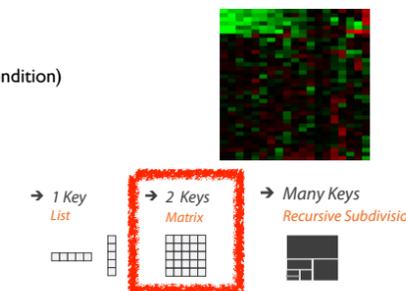

after [Bars and Lines: A Study of Graphic Communication. Zacks and Tversky. Memory and Cognition 27:6 (1999), 1073–1079.]

58

## Idiom: heatmap

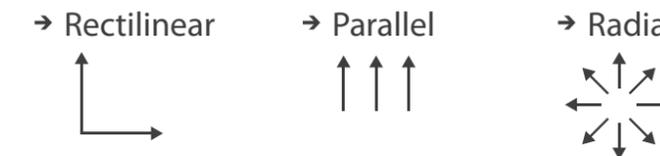

### two keys, one value

- data
  - 2 categ attribs (gene, experimental condition)
  - 1 quant attrib (expression levels)
- marks: area
  - separate and align in 2D matrix
    - indexed by 2 categorical attributes
- channels
  - color by quant attrib
    - (ordered diverging colormap)
- task
  - find clusters, outliers
- scalability
  - 1M items, 100s of categ levels, ~10 quant attrib levels

59

## Axis Orientation

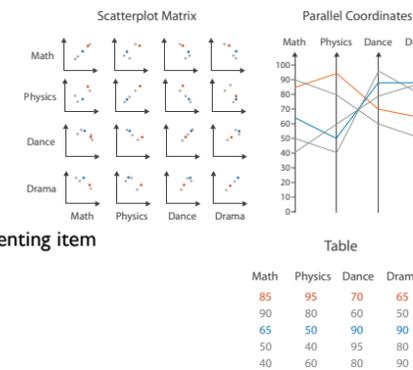

60

## Idioms: scatterplot matrix, parallel coordinates

### scatterplot matrix (SPLOM)

- rectilinear axes, point mark
- all possible pairs of axes
- scalability
  - one dozen attribs
  - dozens to hundreds of items
- **parallel coordinates**
  - parallel axes, jagged line representing item
  - rectilinear axes, item as point
    - axis ordering is major challenge
  - scalability
    - dozens of attribs
    - hundreds of items

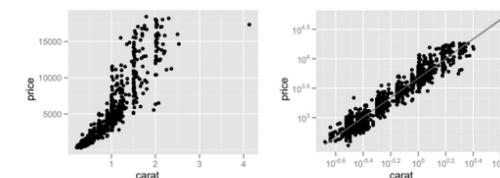

offer [Visualization Course Figures. McGuffin, 2014. <http://www.michaelmcguffin.com/courses/vis/>]

61

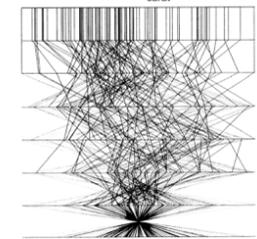

## Task: Correlation

### scatterplot matrix

- positive correlation
  - diagonal low-to-high
- negative correlation
  - diagonal high-to-low
- uncorrelated
- **parallel coordinates**
  - positive correlation
    - parallel line segments
  - negative correlation
    - all segments cross at halfway point
  - uncorrelated
    - scattered crossings

[A layered grammar of graphics. Wickham. Journ. Computational and Graphical Statistics 19:1 (2010), 3–28.]

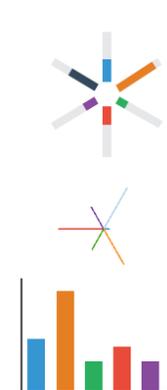

[Hyperdimensional Data Analysis Using Parallel Coordinates. Wigman. Journ. American Statistical Association 85:411 (1990), 664–675.]

62

## Idioms: radial bar chart, star plot

- **radial bar chart**
  - radial axes meet at central ring, line mark
- **star plot**
  - radial axes, meet at central point, line mark
- **bar chart**
  - rectilinear axes, aligned vertically
- **accuracy**
  - length unaligned with radial
    - less accurate than aligned with rectilinear

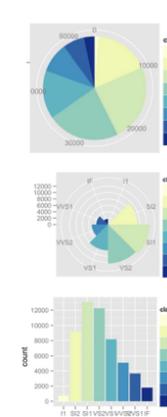

[Visman: Facilitating Risk Assessment and Decision Making In Fisheries Management. Booshehri, Müller, Peterman, and Munszner. Technical Report TR 2011-04, Simon Fraser University, School of Computing Science, 2011.]

63

## Idioms: pie chart, polar area chart

- **pie chart**
  - area marks with angle channel
  - accuracy: angle/area less accurate than line length
    - arclength also less accurate than line length
- **polar area chart**
  - area marks with length channel
  - more direct analog to bar charts
- **data**
  - 1 categ key attrib, 1 quant value attrib
- **task**
  - part-to-whole judgements

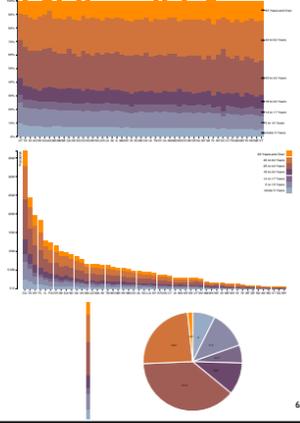

[A layered grammar of graphics. Wickham. Journ. Computational and Graphical Statistics 19:1 (2010), 3–28.]

64

## Idioms: **normalized stacked bar chart**

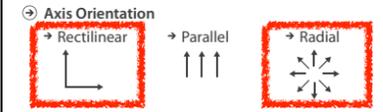

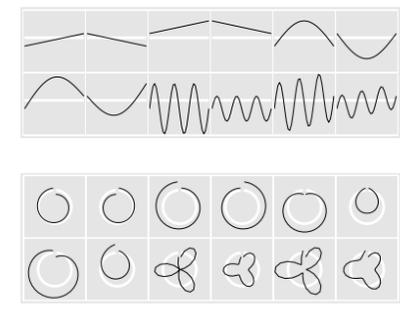

- task
  - part-to-whole judgements
- normalized stacked bar chart
  - stacked bar chart, normalized to full vert height
  - single stacked bar equivalent to full pie
    - high information density: requires narrow rectangle
- pie chart
  - information density: requires large circle

<http://bl.ocks.org/mbostock/3887235>  
<http://bl.ocks.org/mbostock/3886208>  
<http://bl.ocks.org/mbostock/3886394>

## Idiom: **glyphmaps**

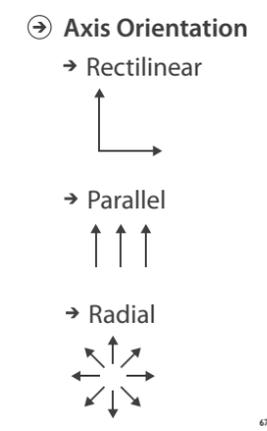

- rectilinear good for linear vs nonlinear trends
- radial good for cyclic patterns

[Glyph-maps for Visually Exploring Temporal Patterns in Climate Data and Models. Wickham, Heymann, Wickham, and Cook. *Environmetrics* 23:5 (2012), 382–393.]

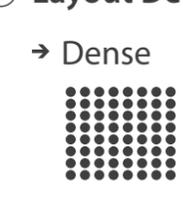

## Orientation limitations

- rectilinear: scalability wrt #axes
  - 2 axes best
  - 3 problematic
    - more in afternoon
  - 4+ impossible
- parallel: unfamiliarity, training time
- radial: perceptual limits
  - angles lower precision than lengths
  - asymmetry between angle and length
    - can be exploited!

[Uncovering Strengths and Weaknesses of Radial Visualizations - an Empirical Approach. Diehl, Beck and Burch. *IEEE TVCG (Proc. InfoVis)* 16(6):935–942, 2010.]

## Layout Density

## dense software overviews

[Visualization of test information to assist fault localization. Jones, Harrold, Staska. *Proc. ICSE* 2002, p. 467-477.]

## Further reading

  - Chap 7: Arrange Tables
- Visualizing Data. Cleveland. Hobart Press, 1993.
- A Brief History of Data Visualization. Friendly. 2008. <http://www.datavis.ca/milestones>

## Outline

- Session 1 8:30-10:00am Visualization Analysis Framework**
  - Introduction: Definitions
  - Analysis: What, Why, How
  - Marks and Channels
- Session 2 10:30am-12:00pm Spatial Layout**
  - Arrange Tables
  - Arrange Spatial Data
  - Arrange Networks and Trees
- Session 3 1:00-2:30pm Color & Interaction**
  - Map Color
  - Manipulate: Change, Select, Navigate
  - Facet: Juxtapose, Partition, Superimpose
- Session 4 3:00-4:30pm Guidelines and Examples**
  - Reduce: Filter, Aggregate
  - Rules of Thumb
  - Q&A

<http://www.cs.ubc.ca/~tmm/talks.html#vad16act> @tamaramunzner

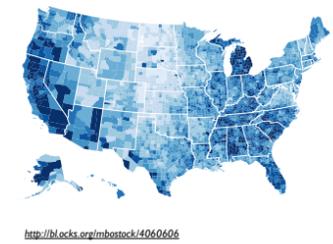

## Arrange spatial data

- Use Given
  - Geometry
    - Geographic
    - Other Derived
  - Spatial Fields
    - Scalar Fields (one value per cell)
      - Isocontours
      - Direct Volume Rendering
    - Vector and Tensor Fields (many values per cell)
      - Flow Glyphs (local)
      - Geometric (sparse seeds)
      - Textures (dense seeds)
      - Features (globally derived)

## Idiom: **choropleth map**

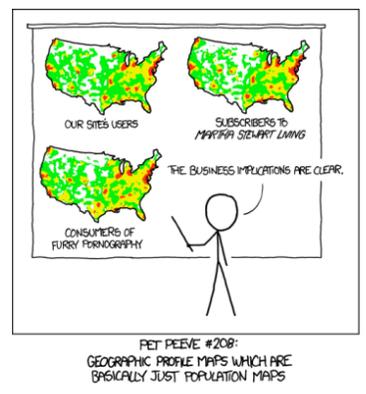

- use given spatial data
  - when central task is understanding spatial relationships
- data
  - geographic geometry
  - table with 1 quant attribute per region
- encoding
  - use given geometry for area mark boundaries
  - sequential segmented colormap [more later]

<http://bl.ocks.org/mbostock/4060606>

## Beware: Population maps trickiness!

[ <https://xkcd.com/1138> ]

## Idiom: **topographic map**

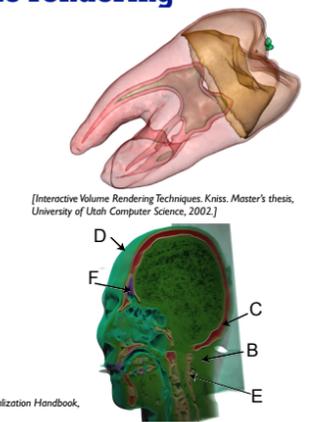

- data
  - geographic geometry
  - scalar spatial field
    - 1 quant attribute per grid cell
- derived data
  - isoline geometry
    - isocontours computed for specific levels of scalar values

Land Information New Zealand Data Service

## Idioms: **isosurfaces, direct volume rendering**

- data
  - scalar spatial field
    - 1 quant attribute per grid cell
- task
  - shape understanding, spatial relationships
- isosurface
  - derived data: isocontours computed for specific levels of scalar values
- direct volume rendering
  - transfer function maps scalar values to color, opacity

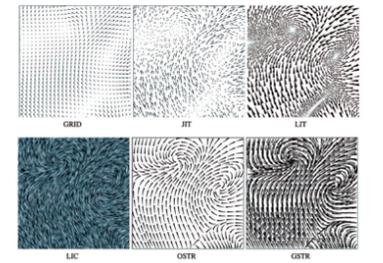

[Interactive Volume Rendering Techniques. Kniss. Master's thesis, University of Utah Computer Science, 2002.]

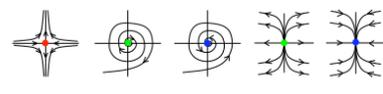

[Multidimensional Transfer Functions for Volume Rendering. Kniss, Kindmann, and Hansen. In *The Visualization Handbook*, edited by Charles Hansen and Christopher Johnson, pp. 189–210. Elsevier, 2005.]

## Vector and tensor fields

- data
  - many attribs per cell
- idiom families
  - flow glyphs
    - purely local
  - geometric flow
    - derived data from tracing particle trajectories
    - sparse set of seed points
  - texture flow
    - derived data, dense seeds
  - feature flow
    - global computation to detect features
    - encoded with one of methods above

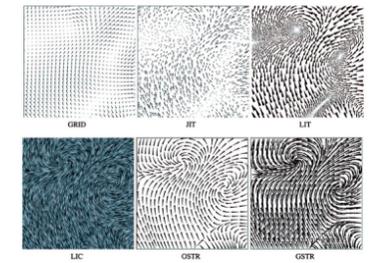

[Comparing 2D vector field visualization methods: A user study. Laidlaw et al. *IEEE Trans. Visualization and Computer Graphics (TVCG)* 11:1 (2005), 59–70.]

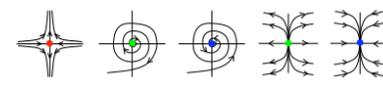

[Topology tracking for the visualization of time-dependent two-dimensional flows. Tricoche, Wächter, Scheuermann, and Hagen. *Computers & Graphics* 26:2 (2002), 249–257.]

## Vector fields

- empirical study tasks
  - finding critical points, identifying their types
  - identifying what type of critical point is at a specific location
  - predicting where a particle starting at a specified point will end up (advection)

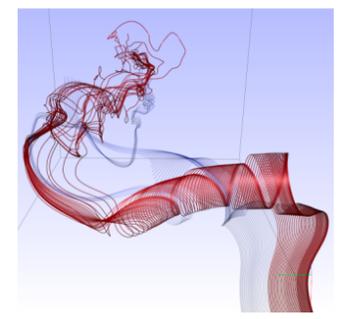

[Comparing 2D vector field visualization methods: A user study. Laidlaw et al. *IEEE Trans. Visualization and Computer Graphics (TVCG)* 11:1 (2005), 59–70.]

[Topology tracking for the visualization of time-dependent two-dimensional flows. Tricoche, Wächter, Scheuermann, and Hagen. *Computers & Graphics* 26:2 (2002), 249–257.]

## Idiom: **similarity-clustered streamlines**

- data
  - 3D vector field
- derived data (from field)
  - streamlines: trajectory particle will follow
- derived data (per streamline)
  - curvature, torsion, tortuosity
  - signature: complex weighted combination
  - compute cluster hierarchy across all signatures
  - encode: color and opacity by cluster
- tasks
  - find features, query shape
- scalability
  - millions of samples, hundreds of streamlines

[Similarity Measures for Enhancing Interactive Streamline Seeding. McLoughlin, Jones, Laramee, Malki, Masters, and Hansen. *IEEE Trans. Visualization and Computer Graphics* 19:8 (2013), 1342–1353.]

## Outline

- Session 1 8:30-10:00am Visualization Analysis Framework**
  - Introduction: Definitions
  - Analysis: What, Why, How
  - Marks and Channels
- Session 2 10:30am-12:00pm Spatial Layout**
  - Arrange Tables
  - Arrange Spatial Data
  - Arrange Networks and Trees
- Session 3 1:00-2:30pm Color & Interaction**
  - Map Color
  - Manipulate: Change, Select, Navigate
  - Facet: Juxtapose, Partition, Superimpose
- Session 4 3:00-4:30pm Guidelines and Examples**
  - Reduce: Filter, Aggregate
  - Rules of Thumb
  - Q&A

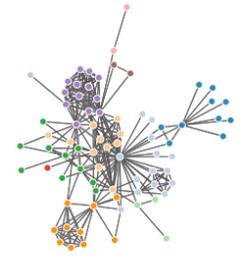

<http://www.cs.ubc.ca/~tmm/talks.html#vad16act> @tamaramunzner

# Arrange networks and trees

- Node-Link Diagrams**
  - Connection Marks
  - ✓ NETWORKS ✓ TREES
- Adjacency Matrix**
  - Derived Table
  - ✓ NETWORKS ✓ TREES
- Enclosure**
  - Containment Marks
  - ✗ NETWORKS ✓ TREES

# Idiom: force-directed placement

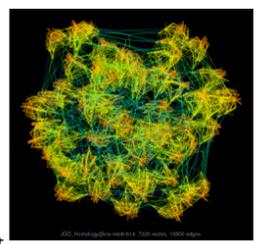

- visual encoding
  - link connection marks, node point marks
- considerations
  - spatial position: no meaning directly encoded
    - left free to minimize crossings
  - proximity semantics?
    - sometimes meaningful
    - sometimes arbitrary, artifact of layout algorithm
    - tension with length
      - long edges more visually salient than short
- tasks
  - explore topology; locate paths, clusters
- scalability
  - node/edge density  $E < 4N$

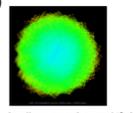

<http://mbostock.github.com/d3/lex/force.html>

# Idiom: sfdp (multi-level force-directed placement)

- data
  - original: network
  - derived: cluster hierarchy atop it
- considerations
  - better algorithm for same encoding technique
    - same: fundamental use of space
    - hierarchy used for algorithm speed/quality but not shown explicitly
    - (more on algorithm vs encoding in afternoon)
- scalability
  - nodes, edges: 1K-10K
  - hairball problem eventually hits

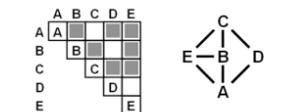

[Efficient and high quality force-directed graph drawing. Hu. The Mathematica Journal 10:37-71, 2005.]

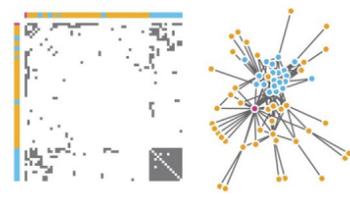

<http://www.research.att.com/yfoshu/GALLERY/GRAPHS/index1.html>

# Idiom: adjacency matrix view

- data: network
  - transform into same data/encoding as heatmap
- derived data: table from network
  - 1 quant attrib
    - weighted edge between nodes
  - 2 categ attribs: node list x 2
- visual encoding
  - cell shows presence/absence of edge
- scalability
  - 1K nodes, 1M edges

[NodeTrix: a Hybrid Visualization of Social Networks. Henry, Fekete, and McGuffin. IEEE TVCG (Proc. InfoVis) 13(6):1302-1309, 2007.]

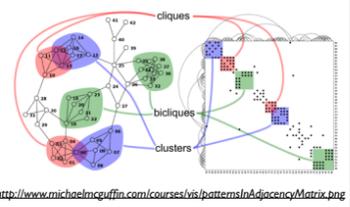

[Points of view: Networks. Gehlenborg and Wang. Nature Methods 9:115.]

# Connection vs. adjacency comparison

- adjacency matrix strengths
  - predictability, scalability, supports reordering
  - some topology tasks trainable
- node-link diagram strengths
  - topology understanding, path tracing
  - intuitive, no training needed
- empirical study
  - node-link best for small networks
  - matrix best for large networks
    - if tasks don't involve topological structure!

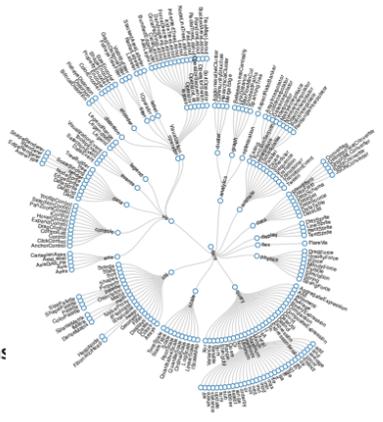

[On the readability of graphs using node-link and matrix-based representations: a controlled experiment and statistical analysis. Ghoniem, Fekete, and Castagliola. Information Visualization 4:2 (2005), 114-135.]

<http://www.michaelmcguffin.com/courses/vis/patterns/AdjacencyMatrix.png>

# Idiom: radial node-link tree

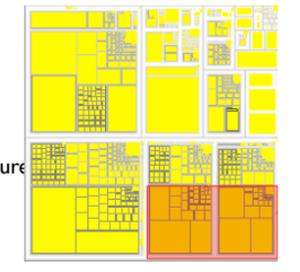

- data
  - tree
- encoding
  - link connection marks
  - point node marks
  - radial axis orientation
    - angular proximity: siblings
    - distance from center: depth in tree
- tasks
  - understanding topology, following paths
- scalability
  - 1K - 10K nodes

<http://mbostock.github.com/d3/lex/tree.html>

# Idiom: treemap

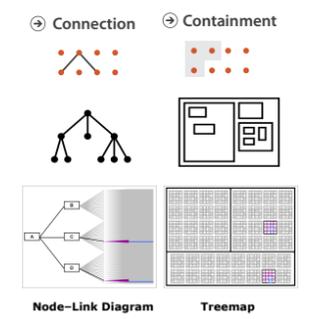

- data
  - tree
  - 1 quant attrib at leaf nodes
- encoding
  - area containment marks for hierarchical structure
  - rectilinear orientation
  - size encodes quant attrib
- tasks
  - query attribute at leaf nodes
- scalability
  - 1M leaf nodes

[http://tulip.libri.fr/Documentation/3\\_7userHandbook/html/ch06.html](http://tulip.libri.fr/Documentation/3_7userHandbook/html/ch06.html)

# Link marks: Connection and containment

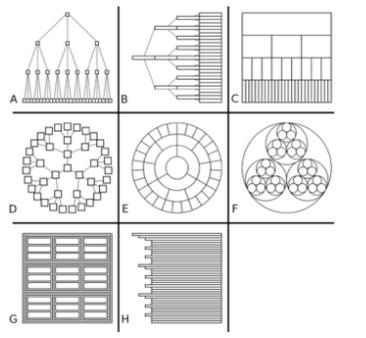

- marks as links (vs. nodes)
  - common case in network drawing
  - 1D case: connection
    - ex: all node-link diagrams
    - emphasizes topology, path tracing
    - networks and trees
  - 2D case: containment
    - ex: all treemap variants
    - emphasizes attribute values at leaves (size coding)
    - only trees

[Elastic Hierarchies: Combining Treemaps and Node-Link Diagrams. Dong, McGuffin, and Chignell. Proc. InfoVis 2005, p. 57-64.]

# Tree drawing idioms comparison

- data shown
  - link relationships
  - tree depth
  - sibling order
- design choices
  - connection vs containment link marks
  - rectilinear vs radial layout
  - spatial position channels
- considerations
  - redundant? arbitrary?
  - information density?
    - avoid wasting space

[Quantifying the Space-Efficiency of 2D Graphical Representations of Trees. McGuffin and Robert. Information Visualization 9:2 (2010), 115-140.]

<http://www.cs.ubc.ca/~tmm/talks.html#vad16act>

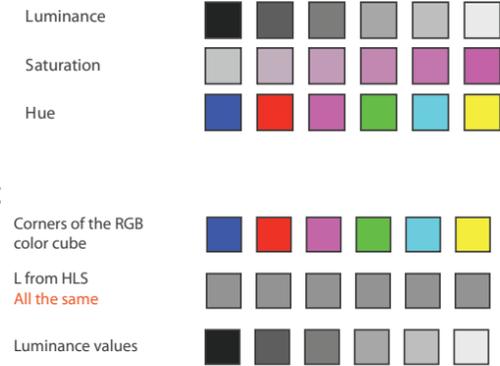

@tamaramunzner

# Categorical vs ordered color

[Seriously Colorful: Advanced Color Principles & Practices. Stone. Tableau Customer Conference 2014.]

# Color: Luminance, saturation, hue

- 3 channels
  - identity for categorical
    - hue
  - magnitude for ordered
    - luminance
    - saturation
- RGB: poor for encoding
- HSL: better, but beware
  - lightness ≠ luminance

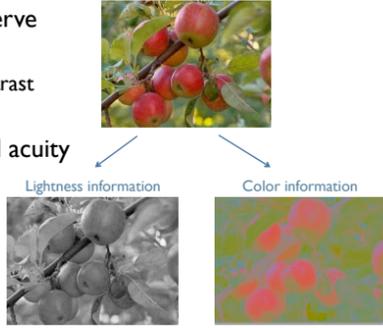

<http://www.cs.ubc.ca/~tmm/talks.html#vad16act>

# Spectral sensitivity

<http://www.cs.ubc.ca/~tmm/talks.html#vad16act>

# Opponent color and color deficiency

- perceptual processing before optic nerve
  - one achromatic luminance channel L
    - edge detection through luminance contrast
  - two chroma channels, R-G and Y-B axis
- "color blind" if one axis has degraded acuity
  - 8% of men are red/green color deficient
  - blue/yellow is rare

[Seriously Colorful: Advanced Color Principles & Practices. Stone. Tableau Customer Conference 2014.]

## Designing for color deficiency: Check with simulator

**Normal vision**   **Deuteranope**   **Protanope**   **Tritanope**

<http://rehue.net>

[Seriously Colorful: Advanced Color Principles & Practices. Stone, Tableau Customer Conference 2014.]

## Designing for color deficiency: Avoid encoding by hue alone

- redundantly encode
  - vary luminance
  - change shape

**Normal**   **Deuteranope simulation**

Change the shape

Vary luminance

[Seriously Colorful: Advanced Color Principles & Practices. Stone, Tableau Customer Conference 2014.]

## Color deficiency: Reduces color to 2 dimensions

**Normal**   **Protanope**

**Deuteranope**   **Tritanope**

[Seriously Colorful: Advanced Color Principles & Practices. Stone, Tableau Customer Conference 2014.]

## Designing for color deficiency: Blue-Orange is safe

[Seriously Colorful: Advanced Color Principles & Practices. Stone, Tableau Customer Conference 2014.]

## Bezold Effect: Outlines matter

- color constancy: simultaneous contrast effect

[Seriously Colorful: Advanced Color Principles & Practices. Stone, Tableau Customer Conference 2014.]

## Color/Lightness constancy: Illumination conditions

Do they match?

## Color/Lightness constancy: Illumination conditions

Do they match?

Image courtesy of John McCann

## Colormaps

- Categorical
  - Binary
  - Ordered
  - Diverging
- Sequential

after [Color Use Guidelines for Mapping and Visualization. Brewer, 1994. <http://www.personal.psu.edu/faculty/c/a/cab38/ColorSch/Schemes.html>]

## Colormaps

- Categorical
- Ordered
- Bivariate

after [Color Use Guidelines for Mapping and Visualization. Brewer, 1994. <http://www.personal.psu.edu/faculty/c/a/cab38/ColorSch/Schemes.html>]

## Colormaps

- Categorical
- Ordered
- Bivariate

use with care!

after [Color Use Guidelines for Mapping and Visualization. Brewer, 1994. <http://www.personal.psu.edu/faculty/c/a/cab38/ColorSch/Schemes.html>]

## Colormaps

- Categorical
- Ordered
- Bivariate

- color channel interactions
  - size heavily affects salience
    - small regions need high saturation
    - large need low saturation
  - saturation & luminance: 3-4 bins max
  - also not separable from transparency

after [Color Use Guidelines for Mapping and Visualization. Brewer, 1994. <http://www.personal.psu.edu/faculty/c/a/cab38/ColorSch/Schemes.html>]

## Categorical color: Discriminability constraints

- noncontiguous small regions of color: only 6-12 bins

[Cinty: flexible analysis and visualization of synteny and genome rearrangements in multiple organisms. Sinha and Meller. BMC Bioinformatics, 8:82, 2007.]

## ColorBrewer

- <http://www.colorbrewer2.org>
- saturation and area example: size affects salience!

[Why Should Engineers Be Worried About Color? Treish and Ragwitz, 1998. <http://www.research.ibm.com/people/treish/color/color.htm>]

## Ordered color: Rainbow is poor default

- problems
  - perceptually unordered
  - perceptually nonlinear
- benefits
  - fine-grained structure visible and nameable

[Why Should Engineers Be Worried About Color? Treish and Ragwitz, 1998. <http://www.research.ibm.com/people/treish/color/color.htm>]

## Ordered color: Rainbow is poor default

- problems
  - perceptually unordered
  - perceptually nonlinear
- benefits
  - fine-grained structure visible and nameable
- alternatives
  - large-scale structure: fewer hues

[Why Should Engineers Be Worried About Color? Treish and Ragwitz, 1998. <http://www.research.ibm.com/people/treish/color/color.htm>]

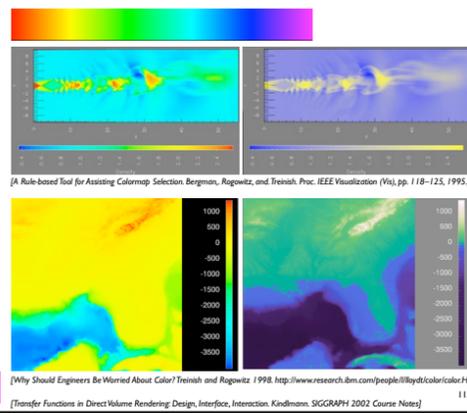

## Ordered color: Rainbow is poor default

- problems
  - perceptually unordered
  - perceptually nonlinear
- benefits
  - fine-grained structure visible and nameable
- alternatives
  - large-scale structure: fewer hues
  - fine structure: multiple hues with monotonically increasing luminance [eg viridis R/python]

[Why Should Engineers Be Worried About Color? Treish and Ragwitz, 1998. <http://www.research.ibm.com/people/treish/color/color.htm>]

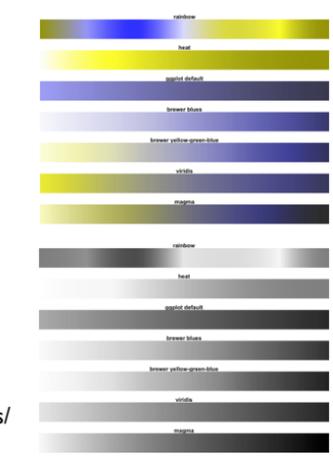

## Ordered color: Rainbow is poor default

- problems
  - perceptually unordered
  - perceptually nonlinear
- benefits
  - fine-grained structure visible and nameable
- alternatives
  - large-scale structure: fewer hues
  - fine structure: multiple hues with monotonically increasing luminance [eg viridis R/python]
  - segmented rainbows for binned

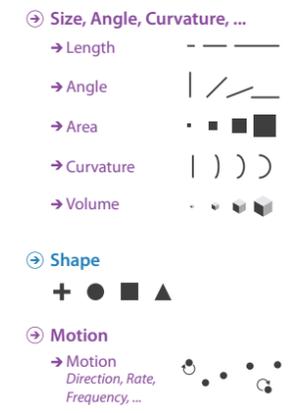

## Viridis

- colorful, perceptually uniform, colorblind-safe, monotonically increasing luminance
- <https://cran.r-project.org/web/packages/viridis/vignettes/intro-to-viridis.html>

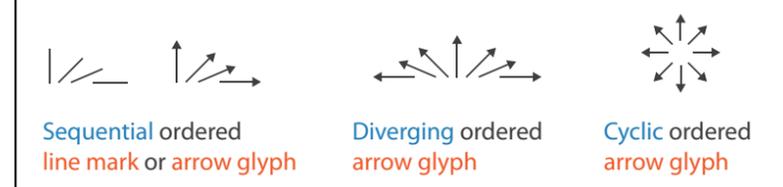

## Map other channels

- size
  - length accurate, 2D area ok, 3D volume poor
- angle
  - nonlinear accuracy
    - horizontal, vertical, exact diagonal
- shape
  - complex combination of lower-level primitives
  - many bins
- motion
  - highly separable against static
    - binary: great for highlighting
  - use with care to avoid irritation

## Angle

## Outline

- Session 1 8:30-10:00am Visualization Analysis Framework**
    - Introduction: Definitions
    - Analysis: What, Why, How
    - Marks and Channels
  - Session 2 10:30am-12:00pm Spatial Layout**
    - Arrange Tables
    - Arrange Spatial Data
    - Arrange Networks and Trees
  - Session 3 1:00-2:30pm Color & Interaction**
    - Map Color
    - Manipulate: Change, Select, Navigate
    - Facet: Juxtapose, Partition, Superimpose
  - Session 4 3:00-4:30pm Guidelines and Examples**
    - Reduce: Filter, Aggregate
    - Rules of Thumb
    - Q&A
- <http://www.cs.ubc.ca/~tmm/talks.html#vad16act>
- @tamaramunzner

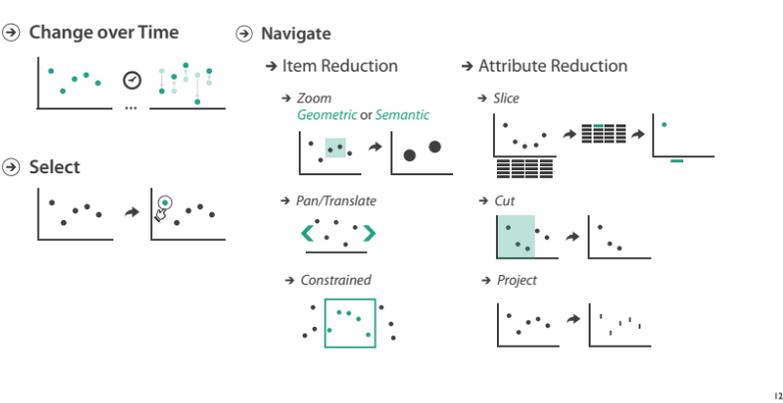

## How?

## How to handle complexity: 1 previous strategy + 3 more

## Manipulate

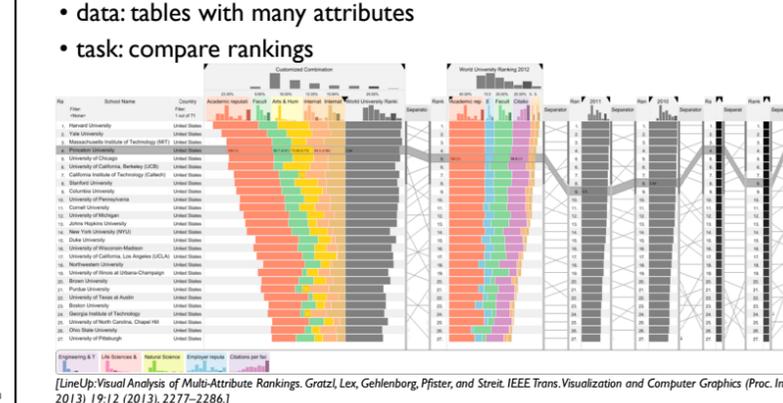

## Change over time

- change any of the other choices
  - encoding itself
  - parameters
  - arrange: rearrange, reorder
  - aggregation level, what is filtered...
- interaction entails change

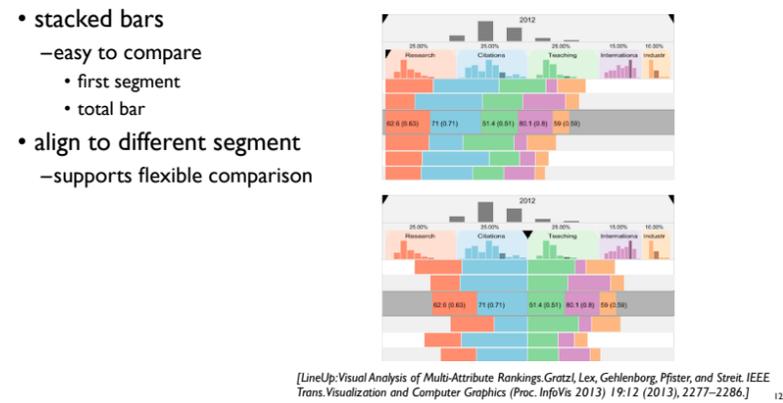

## Idiom: Re-encode System: Tableau

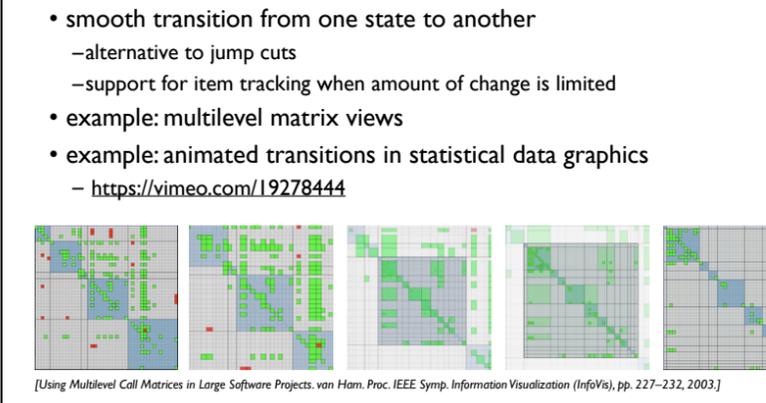

## Idiom: Reorder System: LineUp

## Idiom: Realign System: LineUp

## Idiom: Animated transitions

## Select and highlight

- selection: basic operation for most interaction
- design choices
  - how many selection types?
    - click vs hover: heavyweight, lightweight
    - primary vs secondary: semantics (eg source/target)
- highlight: change visual encoding for selection targets
  - color
    - limitation: existing color coding hidden
  - other channels (eg motion)
  - add explicit connection marks between items

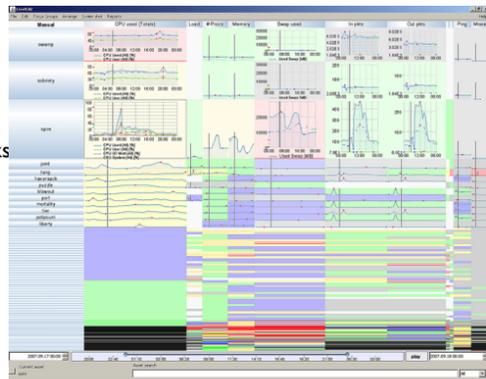

## Navigate: Changing item visibility

- change viewpoint
  - changes which items are visible within view
  - camera metaphor
    - zoom
      - geometric zoom: familiar semantics
      - semantic zoom: adapt object representation based on available pixels
        - » dramatic change, or more subtle one
    - pan/translate
    - rotate
      - especially in 3D
  - constrained navigation
    - often with animated transitions
    - often based on selection set

## Idiom: Semantic zooming

## System: LiveRAC

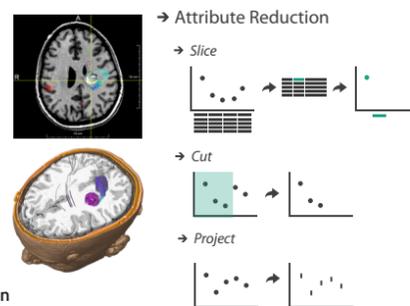

- visual encoding change
  - colored box
  - sparkline
  - simple line chart
  - full chart: axes and tickmarks

[LiveRAC - Interactive Visual Exploration of System Management Time-Series Data. McLachlan, Munzner, Koutsosios, and North. Proc. ACM Conf. Human Factors in Computing Systems (CHI), pp. 1483–1492, 2008.]

## Navigate: Reducing attributes

- continuation of camera metaphor
  - slice
    - show only items matching specific value for given attribute: slicing plane
    - axis aligned, or arbitrary alignment
  - cut
    - show only items on far side of plane from camera
  - project
    - change mathematics of image creation
      - orthographic
      - perspective
      - many others: Mercator, cabinet, ...

[Interactive Visualization of Multimodal Volume Data for Neurosurgical Tumor Treatment. Rieder, Ritter, Raspe, and Peitgen. Computer Graphics Forum (Proc. EuroVis 2008) 27:3 (2008), 1055–1062.]

    - Reduce: Filter, Aggregate
    - Rules of Thumb
    - Q&A

<http://www.cs.ubc.ca/~tmm/talks.html#vad16act>

@tamaramunzner

## Facet

- Juxtapose
- Partition
- Superimpose

## Juxtapose and coordinate views

→ Share Encoding: Same/Different

→ Linked Highlighting

→ Share Data: All/Subset/None

→ Share Navigation

## Idiom: Linked highlighting

## System: EDV

- see how regions contiguous in one view are distributed within another
  - powerful and pervasive interaction idiom
- encoding: different
  - multiform
- data: all shared

[Visual Exploration of Large Structured Datasets. Wills. Proc. New Techniques and Trends in Statistics (NTTS), pp. 237–246. IOS Press, 1995.]

## Idiom: bird's-eye maps

## System: Google Maps

- encoding: same
- data: subset shared
- navigation: shared
  - bidirectional linking
- differences
  - viewpoint
  - (size)
- overview-detail

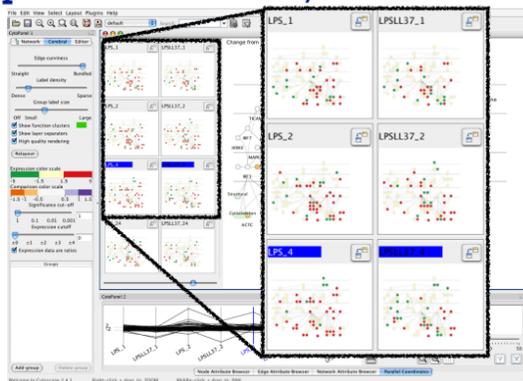

[A Review of Overview+Detail, Zooming, and Focus+Context Interfaces. Cockburn, Karlson, and Bederson. ACM Computing Surveys 41:1 (2008), 1–31.]

## Idiom: Small multiples

## System: Cerebral

- encoding: same
- data: none shared
  - different attributes for node colors
  - (same network layout)
- navigation: shared

[Cerebral: Visualizing Multiple Experimental Conditions on a Graph with Biological Context. Barsky, Munzner, Gardy, and Kincaid. IEEE Trans. Visualization and Computer Graphics (Proc. InfoVis 2008) 14:6 (2008), 1253–1260.]

## Coordinate views: Design choice interaction

		Data		
		All	Subset	None
Encoding	Same	Redundant	Overview/Detail	Small Multiples
	Different	Multiform	Multiform, Overview/Detail	No Linkage

• why juxtapose views?

- benefits: eyes vs memory
  - lower cognitive load to move eyes between 2 views than remembering previous state with single changing view
- costs: display area, 2 views side by side each have only half the area of one view

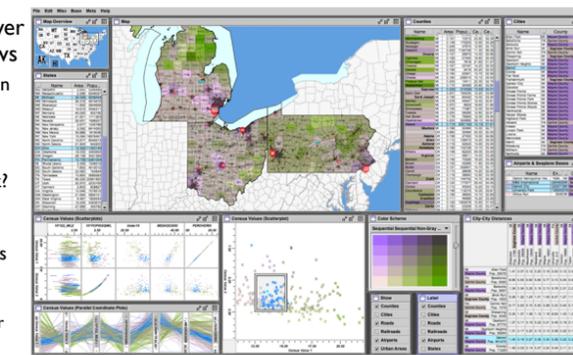

## Why not animation?

- disparate frames and regions: comparison difficult
  - vs contiguous frames
  - vs small region
  - vs coherent motion of group
- safe special case
  - animated transitions

## System: Improve

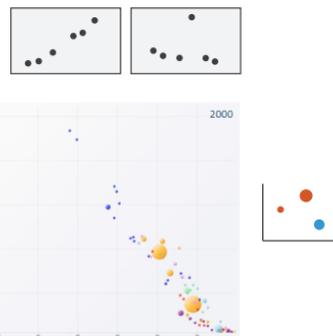

- investigate power of multiple views
  - pushing limits on view count, interaction complexity
  - how many is ok?
    - open research question
  - reorderable lists
    - easy lookup
    - useful when linked to other encodings

[Building Highly-Coordinated Visualizations In Improve. Weaver. Proc. IEEE Symp. Information Visualization (InfoVis), pp. 159–166, 2004.]

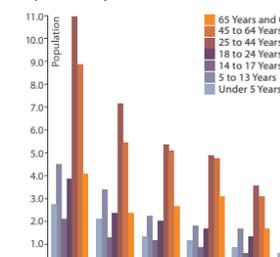

## Partition into views

- how to divide data between views → Partition into Side-by-Side Views
  - split into regions by attributes
  - encodes association between items using spatial proximity
  - order of splits has major implications for what patterns are visible
- no strict dividing line
  - view: big/detailed
    - contiguous region in which visually encoded data is shown on the display
  - glyph: small/iconic
    - object with internal structure that arises from multiple marks

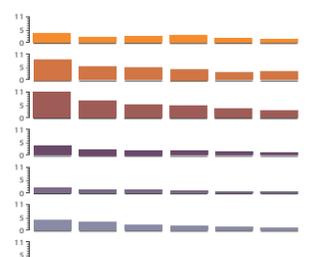

## Partitioning: List alignment

- single bar chart with grouped bars
  - split by state into regions
    - complex glyph within each region showing all ages
  - compare: easy within state, hard across ages

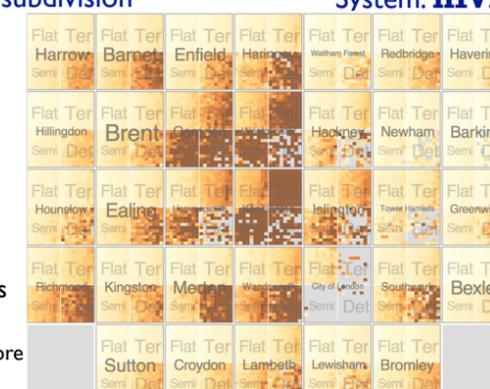

- small-multiple bar charts
  - split by age into regions
    - one chart per region
  - compare: easy within age, harder across states

## Partitioning: Recursive subdivision

## System: HIVE

- split by neighborhood
- then by type
  - years as rows
  - months as columns
- then time
  - years as rows
  - months as columns
- color by price
- neighborhood patterns
  - where it's expensive
  - where you pay much more for detached type

[Configuring Hierarchical Layouts to Address Research Questions. Slingsby, Dykes, and Wood. IEEE Transactions on Visualization and Computer Graphics (Proc. InfoVis 2009) 15:6 (2009), 977–984.]

## Partitioning: Recursive subdivision

## System: HIVE

- switch order of splits
  - type then neighborhood
- switch color
  - by price variation
- type patterns
  - within specific type, which neighborhoods inconsistent

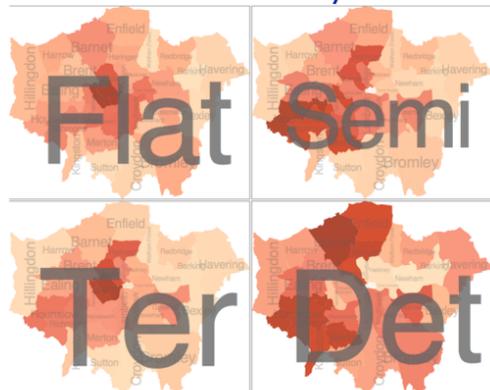

[Configuring Hierarchical Layouts to Address Research Questions. Slingsby, Dykes, and Wood. IEEE Transactions on Visualization and Computer Graphics (Proc. InfoVis 2009) 15:6 (2009), 977–984.]

## Partitioning: Recursive subdivision

System: **HIVE**

- different encoding for second-level regions
- choropleth maps

[Configuring Hierarchical Layouts to Address Research Questions. Slingsby, Dykes, and Wood. IEEE Transactions on Visualization and Computer Graphics (Proc. InfoVis 2009) 15:6 (2009), 977–984.]

## Partitioning: Recursive subdivision

System: **HIVE**

- size regions by sale counts
- not uniformly
- result: treemap

[Configuring Hierarchical Layouts to Address Research Questions. Slingsby, Dykes, and Wood. IEEE Transactions on Visualization and Computer Graphics (Proc. InfoVis 2009) 15:6 (2009), 977–984.]

## Superimpose layers

- layer**: set of objects spread out over region
- each set is visually distinguishable group
- extent: whole view
- design choices
- how many layers, how to distinguish?
- encode with different, nonoverlapping channels
- two layers achievable, three with careful design
- small static set, or dynamic from many possible?

Superimpose Layers

## Static visual layering

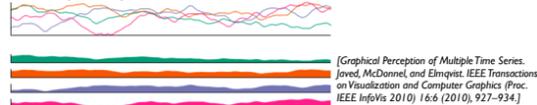

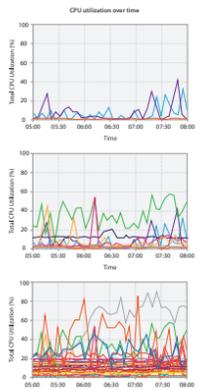

- foreground layer: roads
- hue, size distinguishing main from minor
- high luminance contrast from background
- background layer: regions
- desaturated colors for water, parks, land areas
- user can selectively focus attention
- “get it right in black and white”
- check luminance contrast with greyscale view

[Get it right in black and white. Stone. 2010. <http://www.stones.com/wordpress/2010/03/get-it-right-in-black-and-white/>]

## Superimposing limits

- few layers, but many lines
- up to a few dozen
- but not hundreds
- superimpose vs juxtapose: empirical study
- superimposed for local, multiple for global
- tasks
- local: maximum, global: slope, discrimination
- same screen space for all multiples vs single superimposed

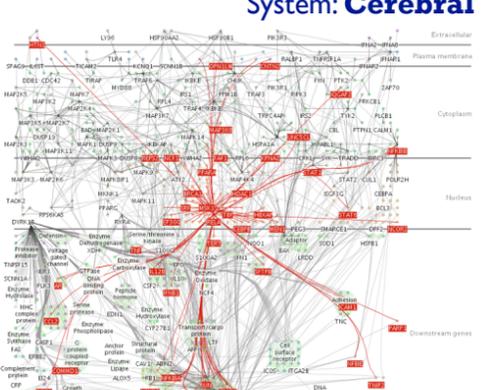

[Graphical Perception of Multiple Time Series. Javed, McDonnell, and Elmqvist. IEEE Transactions on Visualization and Computer Graphics (Proc. InfoVis 2010) 16:6 (2010), 927–934.]

## Dynamic visual layering

System: **Cerebral**

- interactive, from selection
- lightweight: click
- very lightweight: hover
- ex: 1-hop neighbors

[Cerebral: a Cytoscape plugin for layout of and interaction with biological networks using subcellular localization annotation. Barsky, Gardy, Hancock, and Munzner. Bioinformatics 23:8 (2007), 1040–1042.]

## Outline

- Session 1 8:30-10:00am Visualization Analysis Framework**
  - Introduction: Definitions
  - Analysis: What, Why, How
  - Marks and Channels
- Session 2 10:30am-12:00pm Spatial Layout**
  - Arrange Tables
  - Arrange Spatial Data
  - Arrange Networks and Trees
- Session 3 1:00-2:30pm Color & Interaction**
  - Map Color
  - Manipulate: Change, Select, Navigate
  - Facet: Juxtapose, Partition, Superimpose
- Session 4 3:00-4:30pm Guidelines and Examples**
  - Reduce: Filter, Aggregate
  - Rules of Thumb
  - Q&A

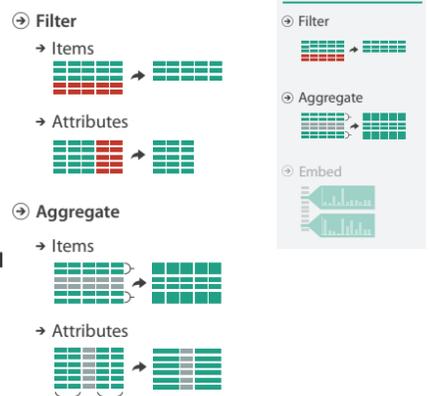

<http://www.cs.ubc.ca/~tmm/talks.html#vad16act>

@tamaramunzner

## Reduce items and attributes

Reducing Items and Attributes

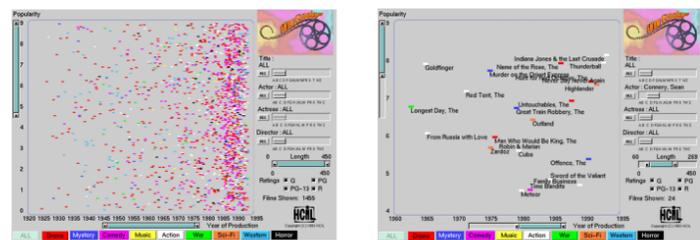

- reduce/increase: inverses
- filter
- pro: straightforward and intuitive
- to understand and compute
- con: out of sight, out of mind
- aggregation
- pro: inform about whole set
- con: difficult to avoid losing signal
- not mutually exclusive
- combine filter, aggregate
- combine reduce, change, facet

## Idiom: dynamic filtering

System: **FilmFinder**

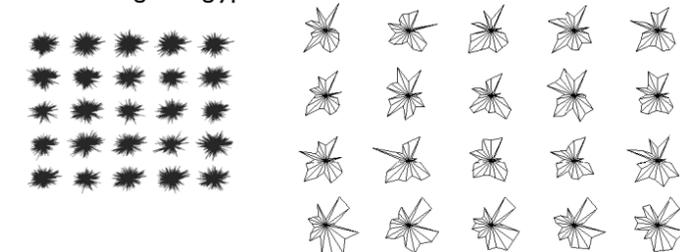

- item filtering
- browse through tightly coupled interaction
- alternative to queries that might return far too many or too few

[Visual information seeking: Tight coupling of dynamic query filters with starfield displays. Ahlberg and Shneiderman. Proc. ACM Conf. on Human Factors in Computing Systems (CHI), pp. 313–317, 1994.]

## Idiom: DOSFA

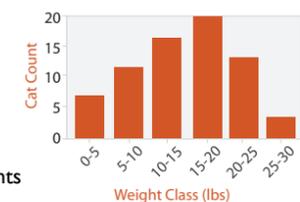

- attribute filtering
- encoding: star glyphs

[Interactive Hierarchical Dimension Ordering, Spacing and Filtering for Exploration Of High Dimensional Datasets. Yang, Peng, Ward, and Rundensteiner. Proc. IEEE Symp. Information Visualization (InfoVis), pp. 105–112, 2003.]

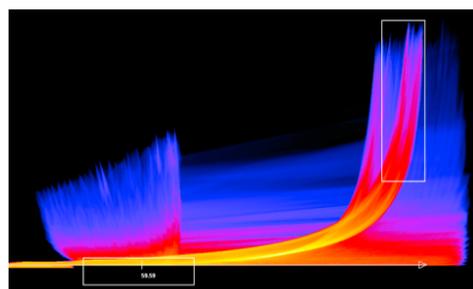

## Idiom: histogram

- static item aggregation
- task: find distribution
- data: table
- derived data
- new table: keys are bins, values are counts
- bin size crucial
- pattern can change dramatically depending on discretization
- opportunity for interaction: control bin size on the fly

## Continuous scatterplot

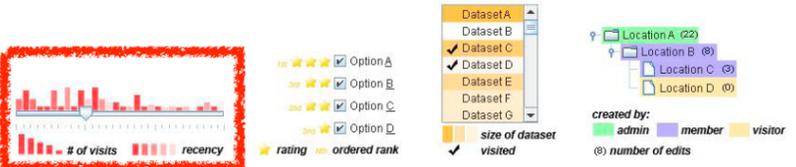

- static item aggregation
- data: table
- derived data: table
- key attribs x,y for pixels
- quant attrib: overplot density
- dense space-filling 2D matrix
- color: sequential categorical hue + ordered luminance

[Continuous Scatterplots. Bachthaler and Weiskopf. IEEE TVCG (Proc. Vis 08) 14:6 (2008), 1428–1435. 2008.]

## Idiom: scented widgets

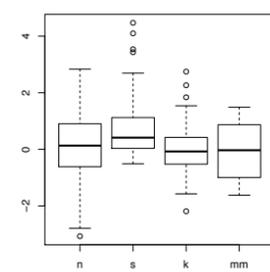

- augment widgets for filtering to show information scent
- cues to show whether value in drilling down further vs looking elsewhere
- concise, in part of screen normally considered control panel

[Scented Widgets: Improving Navigation Cues with Embedded Visualizations. Willett, Heer, and Agrawala. IEEE Trans. Visualization and Computer Graphics (Proc. InfoVis 2007) 13:6 (2007), 1129–1136.]

## Idiom: boxplot

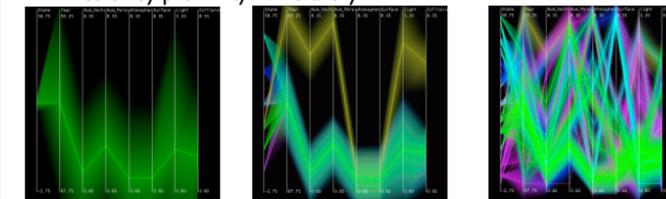

- static item aggregation
- task: find distribution
- data: table
- derived data
- 5 quant attribs
- median: central line
- lower and upper quartile: boxes
- lower upper fences: whiskers
- values beyond which items are outliers
- outliers beyond fence cutoffs explicitly shown

[40 years of boxplots. Wickham and Stryjewski. 2012. had.co.nz]

## Idiom: Hierarchical parallel coordinates

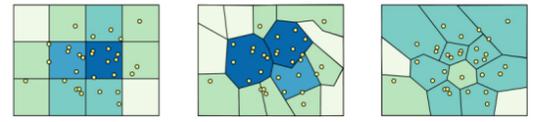

- dynamic item aggregation
- derived data: hierarchical clustering
- encoding:
- cluster band with variable transparency, line at mean, width by min/max values
- color by proximity in hierarchy

[Hierarchical Parallel Coordinates for Exploration of Large Datasets. Fua, Ward, and Rundensteiner. Proc. IEEE Visualization Conference (Vis '99), pp. 43–50, 1999.]

## Spatial aggregation

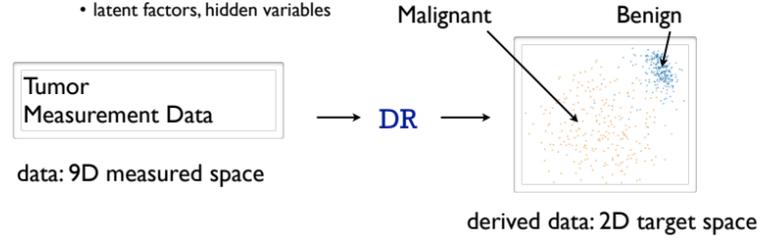

- MAUP: Modifiable Areal Unit Problem
  - gerrymandering (manipulating voting district boundaries) is one example!

[http://www.e-education.psu.edu/geog486/14\_p7.html, Fig 4.cg.6]

## Dimensionality reduction

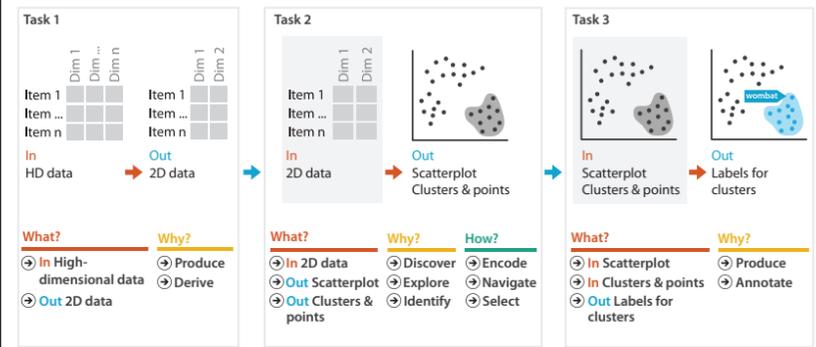

- attribute aggregation
  - derive low-dimensional target space from high-dimensional measured space
  - use when you can't directly measure what you care about
    - true dimensionality of dataset conjectured to be smaller than dimensionality of measurements
    - latent factors, hidden variables

161

162

## Idiom: Dimensionality reduction for documents

163

  - Map Color
  - Manipulate: Change, Select, Navigate
  - Facet: Juxtapose, Partition, Superimpose
- Session 4 3:00-4:30pm Guidelines and Examples
  - Reduce: Filter, Aggregate
  - Rules of Thumb
  - Q&A

http://www.cs.ubc.ca/~tmm/talks.html#vad16act

@tamaramunzner

165

## Rules of Thumb

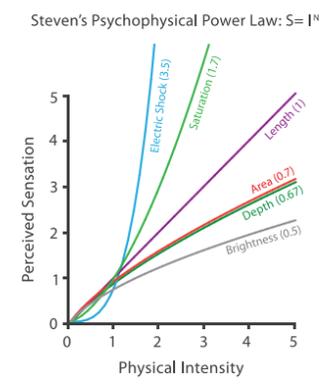

- No unjustified 3D
  - Power of the plane
  - Disparity of depth
  - Occlusion hides information
  - Perspective distortion dangers
  - Tilted text isn't legible
- No unjustified 2D
- Eyes beat memory
- Resolution over immersion
- Overview first, zoom and filter, details on demand
- Responsiveness is required
- Function first, form next

166

## No unjustified 3D: Power of the plane

- high-ranked spatial position channels: planar spatial position
  - not depth!

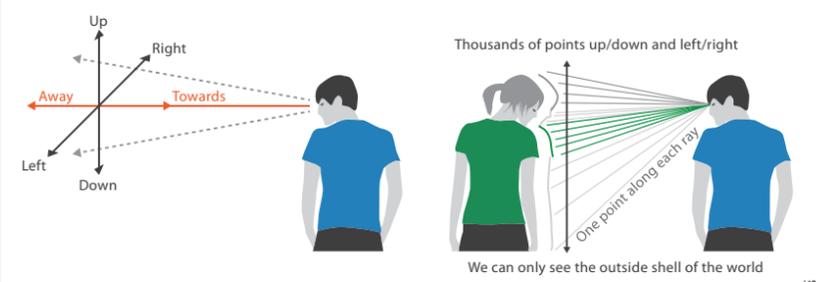

- Magnitude Channels: Ordered Attributes
  - Position on common scale
  - Position on unaligned scale
  - Length (1D size)
  - Tilt/angle
  - Area (2D size)
  - Depth (3D position)

167

## No unjustified 3D: Danger of depth

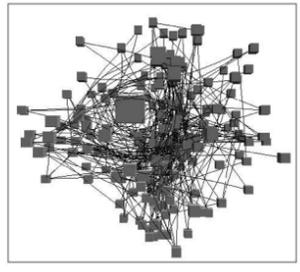

- we don't really live in 3D: we see in 2.05D
  - acquire more info on image plane quickly from eye movements
  - acquire more info for depth slower, from head/body motion

168

## Occlusion hides information

- occlusion
- interaction complexity

[Distortion Viewing Techniques for 3D Data. Carpendale et al. InfoVis 1996.]

## Perspective distortion loses information

- perspective distortion
  - interferes with all size channel encodings
  - power of the plane is lost!

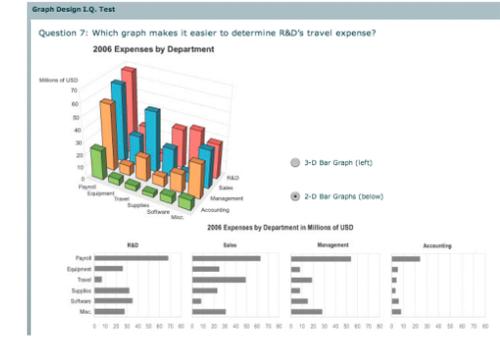

[Visualizing the Results of Multimedia Web Search Engines. Mukherjee, Hirata, and Hara. InfoVis 96]

170

## 3D vs 2D bar charts

- 3D bars never a good idea!

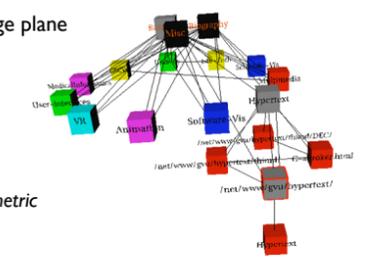

[http://perceptualedge.com/files/GraphDesignIQ.html]

171

## Tilted text isn't legible

- text legibility
  - far worse when tilted from image plane

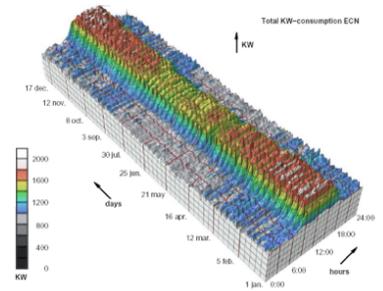

[Exploring and Reducing the Effects of Orientation on Text Readability in Volumetric Displays. Grossman et al. CHI 2007]

[Visualizing the World-Wide Web with the Navigational View Builder. Mukherjee and Foley. Computer Networks and ISDN Systems, 1995.]

172

## No unjustified 3D example: Time-series data

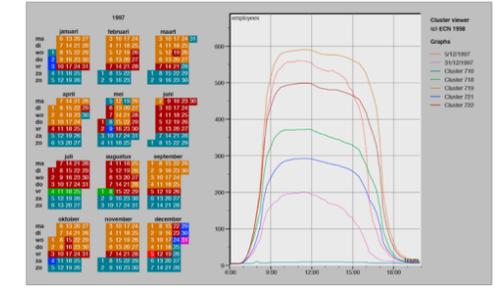

- extruded curves: detailed comparisons impossible

[Cluster and Calendar based Visualization of Time Series Data. van Wijk and van Selow, Proc. InfoVis 99.]

## No unjustified 3D example: Transform for new data abstraction

- derived data: cluster hierarchy
- juxtapose multiple views: calendar, superimposed 2D curves

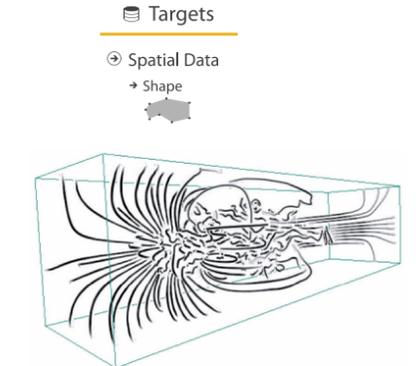

[Cluster and Calendar based Visualization of Time Series Data. van Wijk and van Selow, Proc. InfoVis 99.]

174

## Justified 3D: shape perception

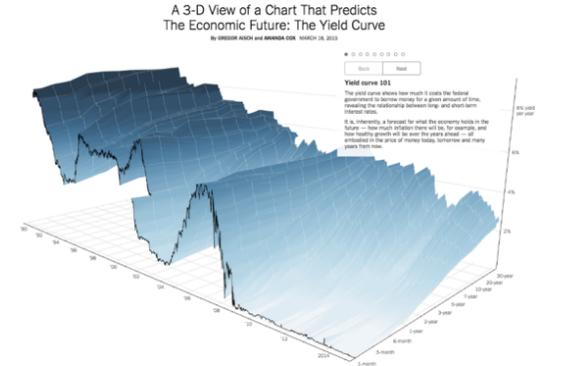

- benefits outweigh costs when task is shape perception for 3D spatial data
  - interactive navigation supports synthesis across many viewpoints

[Image-Based Streamline Generation and Rendering. Li and Shen. IEEE Trans. Visualization and Computer Graphics (TVCG) 13:3 (2007), 630–640.]

175

## Justified 3D: Economic growth curve

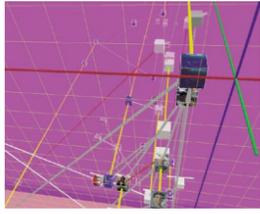

http://www.nytimes.com/interactive/2015/03/19/upshot/3d-yield-curve-economic-growth.html

176

## No unjustified 3D

- 3D legitimate for true 3D spatial data
- 3D needs very careful justification for abstract data
  - enthusiasm in 1990s, but now skepticism
  - be especially careful with 3D for point clouds or networks

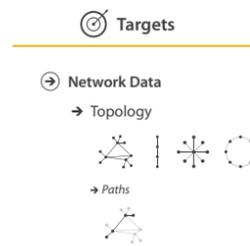

[WEBPATH—a three dimensional Web history. Frecon and Smith. Proc. InfoVis 1999]

177

## No unjustified 2D

- consider whether network data requires 2D spatial layout
  - especially if reading text is central to task!
  - arranging as network means lower information density and harder label lookup compared to text lists
- benefits outweigh costs when topological structure/context important for task
  - be especially careful for search results, document collections, ontologies

178

## Eyes beat memory

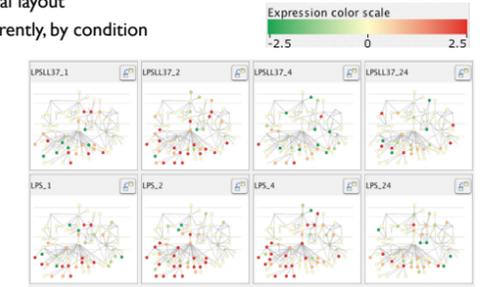

- principle: external cognition vs. internal memory
  - easy to compare by moving eyes between side-by-side views
  - harder to compare visible item to memory of what you saw
- implications for animation
  - great for choreographed storytelling
  - great for transitions between two states
  - poor for many states with changes everywhere
    - consider small multiples instead

179

## Eyes beat memory example: Cerebral

- small multiples: one graph instance per experimental condition
  - same spatial layout
  - color differently, by condition

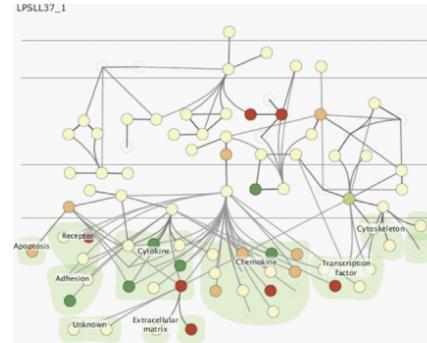

[Cerebral: Visualizing Multiple Experimental Conditions on a Graph with Biological Context. Barsky, Munzner, Gardy, and Kincaid. IEEE Trans. Visualization and Computer Graphics (Proc. InfoVis 2008) 14:6 (2008), 1253–1260.]

180

## Why not animation?

- disparate frames and regions: comparison difficult
  - vs contiguous frames
  - vs small region
  - vs coherent motion of group
- safe special case
  - animated transitions

181

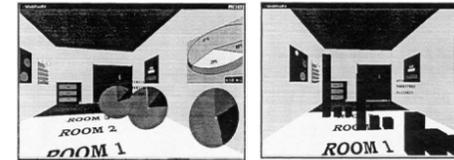

## Change blindness

- if attention is directed elsewhere, even drastic changes not noticeable
  - door experiment
- change blindness demos
  - mask in between images

182

## Resolution beats immersion

- immersion typically not helpful for abstract data
  - do not need sense of presence or stereoscopic 3D
- resolution much more important
  - pixels are the scarcest resource
  - desktop also better for workflow integration
- virtual reality for abstract data very difficult to justify

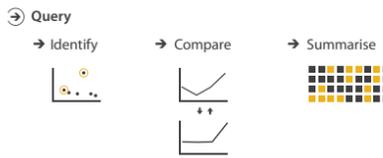

[Development of an information visualization tool using virtual reality. Kirner and Martins. Proc. Symp. Applied Computing 2000]

183

## Overview first, zoom and filter, details on demand

- influential mantra from Shneiderman
  - [The Eyes Have It: A Task by Data Type Taxonomy for Information Visualizations. Shneiderman. Proc. IEEE Visual Languages, pp. 336–343, 1996.]

- overview = summary
  - microcosm of full vis design problem

184

## Responsiveness is required

- three major categories
  - 0.1 seconds: perceptual processing
  - 1 second: immediate response
  - 10 seconds: brief tasks
- importance of visual feedback

185

## Function first, form next

- start with focus on functionality
  - straightforward to improve aesthetics later on, as refinement
  - if no expertise in-house, find good graphic designer to work with
- dangerous to start with aesthetics
  - usually impossible to add function retroactively

186
